Colon & Colorectal Cancer — Clinical Trials Intelligence

Alert Window: Last 30 Days · Generated: 2026-08-03 07:30:00

Situation Summary

Phase Iii: 193 trials
Recruiting: 1062 trials
Biomarker: 897 biomarker-directed trials
Breakthrough: 437 trials scored ≥ 4

Active Trial Timeline

Showing 437 high-significance trials (score ≥ 4). 1340 additional lower-scored trials are collapsed below. Phase III trials appear first. Click any title to view full trial details on ClinicalTrials.gov.

Efficacy of the Use of Neoadjuvant With/Without Hyperthermic Intraperitoneal Chemotherapy in the Treatment of Locally Advanced Colon Cancer

This clinical trial is testing the efficacy of neoadjuvant treatment strategies, with or without hyperthermic intraperitoneal chemotherapy (HIPEC), in patients with locally advanced colon cancer. The intervention involves administering FOLFOX chemotherapy followed by cytoreductive surgery and may include mitomycin C as part of the HIPEC procedure, aiming to improve disease-free survival rates. This is a Phase 3 trial currently recruiting participants, which means eligible patients may have the opportunity to receive a potentially more effective treatment approach compared to standard care. Eligibility criteria include patients with locally advanced colon adenocarcinoma (cT4, cT3 with invasion >5mm) Nx and no metastases, with specific biomarker assessments for MMR, DMMR, and microsatellite status.

NCT: NCT06783491 · Enrollment: 1083 · Sites: Córdoba, Spain

A Clinical Trial Comparing Long-Course Versus Short-Course Radiotherapy Followed by Immunotherapy Combined With Total Neoadjuvant Therapy (TNT) to Long-Course Radiotherapy Followed by TNT in Locally Advanced Rectal Cancer

This clinical trial is testing the efficacy of short-course versus long-course radiotherapy followed by immunotherapy combined with total neoadjuvant therapy (TNT) in patients with locally advanced rectal cancer. The interventions include short-course and long-course radiotherapy, along with the drugs capecitabine, oxaliplatin, and HLX10, which are important for evaluating different treatment approaches. Currently in Phase 3 and actively recruiting, this trial aims to enroll 444 participants, which may provide insights into treatment options for patients. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and RAS.

NCT: NCT07113275 · Enrollment: 444 · Sites: Wuhan, China

A Phase II/III Clinical Trial of RC148 Plus Chemotherapy as 1L Therapy for Unresectable or Metastatic Colorectal Cancer

This clinical trial is evaluating the efficacy and safety of RC148 combined with chemotherapy as a first-line treatment for patients with unresectable or metastatic colorectal cancer. The intervention involves two doses of RC148 alongside Capecitabine and Oxaliplatin, which are standard chemotherapy agents, to assess their combined effectiveness. Currently in Phase II/III and actively recruiting, this trial aims to provide insights into the objective response rate for participants. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and microsatellite status.

NCT: NCT07462143 · Enrollment: 80 · Sites: Beijing, China, Changchun, China, Chengdu, China, Chongqing, China, Fuzhou, China

MEDIUM PHASE3 Stage III MSI/MMR TARGETED THERAPY • RECRUITING 11

Neoadjuvant/Adjuvant AK104 in Microsatellite Instability-high or Mismatch Repair-deficient, Resectable Colon Cancer

This clinical trial is testing the efficacy and safety of neoadjuvant/adjuvant treatment with AK104 (Cadonilimab) in patients with resectable microsatellite instability-high (MSI-H) or mismatch repair-deficient (dMMR) colon cancer. The intervention involves AK104 in combination with standard chemotherapy agents, including Oxaliplatin, Capecitabine, 5-Fluorouracil, and Calcium Folinate, which is significant for potentially improving treatment outcomes in this specific patient population. This is a Phase 3 study currently recruiting 386 participants, indicating that patients may have the opportunity to access this investigational treatment while contributing to important research. Eligibility criteria include having resectable MSI-H or dMMR colon cancer, with specific biomarker requirements related to microsatellite instability and mismatch repair status.

NCT: NCT07412613 · Enrollment: 386 · Sites: Guangzhou, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

Botensilimab + Balstilimab vs Best Supportive Care as Therapy in Chemo-refractory, Unresectable, Colorectal Adenocarcinoma

This clinical trial is testing the combination of botensilimab and balstilimab in patients with chemo-refractory, unresectable colorectal adenocarcinoma. The intervention involves two immunotherapy drugs aimed at potentially improving overall survival and quality of life for participants. Currently in Phase 3 and actively recruiting, this trial may provide insights into treatment options for patients who have limited alternatives. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and microsatellite status.

NCT: NCT07152821 · Enrollment: 834 · Sites: Angers, France, Avignon, France, Besançon, France, Bordeaux, France, Caen, France

MEDIUM PHASE3 Stage IV BRAF TARGETED THERAPY • NOT_YET_RECRUITING 11

JSKN003 Versus Physician Choiced Treatment in Patients With HER2-positive and Advanced Colorectal Cancer Who Had Failed to Respond to Oxaliplatin, 5-Fu, and Irinotecan

This clinical trial is testing the efficacy and safety of the drug JSKN003 compared to physician-chosen treatments in patients with HER2-positive and advanced colorectal cancer who have not responded to previous therapies, including oxaliplatin, 5-FU, and irinotecan. The intervention involves administering JSKN003 alongside options like TAS-102, regorafenib, and fruquintinib, which are significant as they represent standard treatment choices for this patient population. This is a Phase 3 trial that is currently not yet recruiting, meaning patients will need to wait for enrollment to begin before participating. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, MMR, DMMR, HER2, and RAS.

NCT: NCT07384377 · Enrollment: 123 ·

MEDIUM PHASE3 Stage IV BRAF TARGETED THERAPY • RECRUITING 11

Symbiotic-GI-03: A Study to Learn About the Study Medicine Called PF-08634404 in Combination With Chemotherapy in Adult Participants With Metastatic Colorectal Cancer

The Symbiotic-GI-03 trial is investigating the efficacy of PF-08634404 in combination with chemotherapy in adult participants with metastatic colorectal cancer. This study aims to determine how well PF-08634404 works alongside standard chemotherapy and Bevacizumab, which are already approved for treating this type of cancer. Currently in Phase 3 and actively recruiting 800 participants, this trial seeks to assess progression-free survival as its primary outcome. Eligible participants must be 18 years or older, have metastatic colorectal cancer, and be in sufficient health to receive the study treatment.

NCT: NCT07222800 · Enrollment: 800 · Sites: Aberdeen, Abilene, Albany, Amarillo, Arlington

HIGH PHASE3 Stage IV BRAF TARGETED THERAPY • RECRUITING 11

Phase III Study of Ivonescimab or Bevacizumab Combined With FOLFOX in Patients With Metastatic Colorectal Cancer

This Phase III clinical trial is evaluating the efficacy of Ivonescimab compared to Bevacizumab when combined with FOLFOX in patients with metastatic colorectal cancer. The intervention involves administering either Ivonescimab or Bevacizumab alongside the chemotherapy regimen mFOLFOX6, which is significant for assessing potential improvements in treatment outcomes. Currently, the trial is in the recruiting phase, meaning eligible patients can participate and contribute to the research. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, MMR, DMMR, and microsatellite status.

NCT: NCT07228832 · Enrollment: 600 · Sites: Akron, Atlanta, Baltimore, Beverly Hills, Billings

HIGH PHASE3 Stage IV PHASE III TRIAL • RECRUITING 11

A Randomized, Double-blind, Placebo-controlled, Parallel-group, Comparative, Phase III Study to Evaluate the Efficacy and Safety of Nuvastatic® 300mg Capsule in Reducing Cancer-Tumor in Patients With Metastatic Colorectal Cancer Receiving Standard Chemotherapy.

This clinical trial is testing the efficacy and safety of Nuvastatic® 300mg capsules in reducing cancer-related fatigue in patients with metastatic colorectal cancer who are receiving standard chemotherapy. The intervention involves administering Nuvastatic 300 or a placebo three times daily for six cycles, with the aim of determining if Nuvastatic can significantly improve fatigue scores while maintaining safety. This is a Phase III study currently recruiting 250 participants, which means eligible patients may have the opportunity to contribute to the evaluation of this treatment's effectiveness in a larger population. Eligibility criteria include being an adult patient with metastatic colorectal cancer undergoing first-line chemotherapy.

NCT: NCT07669454 · Enrollment: 250 · Sites: Erode, India, Jalgaon, India, Kanpur, India, Mysore, India, Pune, India

HIGH PHASE3 Stage III MSI/MMR TARGETED THERAPY • RECRUITING 11

Neoadjuvant Radiotherapy for Rectal Adenocarcinoma With Capecitabine Versus TAS-102 (Neo-REACT): A Multi-center, Randomized, Phase III Trial

This clinical trial, titled Neo-REACT, is testing the efficacy of TAS-102 compared to capecitabine in patients with locally advanced rectal adenocarcinoma undergoing neoadjuvant treatment. The intervention involves administering TAS-102, an oral anti-tumor formulation, alongside radiotherapy, which may offer improved outcomes over the standard capecitabine regimen. Currently in Phase III and actively recruiting 210 participants, this trial aims to assess the complete response rate, providing critical data for treatment decisions. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, and DMMR status.

NCT: NCT06850090 · Enrollment: 210 · Sites: Jinan, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • NOT_YET_RECRUITING 11

Irinotecan Liposomes in Total Neoadjuvant Therapy in Locally Advanced Rectal Cancer

This clinical trial is testing the efficacy and safety of irinotecan liposomes in combination with standard total neoadjuvant therapy for patients with locally advanced rectal cancer. The intervention involves the use of NALIRI (irinotecan liposomes), along with LCRT (radiation) and FOLFOX (chemotherapy), to evaluate its impact on treatment outcomes. This is a Phase 3 trial that is not yet recruiting, meaning patients will need to wait for enrollment to begin before participating. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, microsatellite status, and mismatch repair status.

NCT: NCT07074353 · Enrollment: 360 · Sites: Hangzhou, China

MEDIUM PHASE2, PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

Node-Sparing Short-Course Radiotherapy Plus Chemotherapy, Bevacizumab and PD-1 Inhibitor in Metastatic pMMR/MSS Colorectal Cancer (MODIFI-CRC)

This clinical trial, known as MODIFI-CRC, is testing the effectiveness of node-sparing short-course radiotherapy combined with chemotherapy, bevacizumab, and a PD-1 inhibitor in patients with metastatic pMMR/MSS colorectal cancer. The intervention aims to enhance tumor response by utilizing radiotherapy to improve the efficacy of immunotherapy and targeted treatments, addressing the limitations of current standard therapies. Currently in Phase 2/3 and actively recruiting participants, this trial may offer patients an opportunity to receive a potentially more effective treatment regimen. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and NGS.

NCT: NCT06958419 · Enrollment: 286 · Sites: Guangzhou, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

PRODIGE 90

The PRODIGE 90 trial is investigating the combination of neoadjuvant Dostarlimab and short course radiotherapy for patients with microsatellite unstable or mismatch repair-deficient locally advanced rectal cancer. The intervention involves administering Dostarlimab, an anti-PD1 immunotherapy, alongside radiotherapy, which may offer a nonoperative management strategy for patients who achieve no detectable residual cancer after treatment. This is a Phase 3 trial currently recruiting participants, which means eligible patients may have the opportunity to access this investigational approach while contributing to the understanding of its effectiveness. Eligibility criteria include specific biomarkers such as MSI, MMR, and RAS status, which are important for determining patient suitability for the trial.

NCT: NCT06762405 · Enrollment: 68 · Sites: Dijon, France

MEDIUM PHASE3 All Stages KRAS TARGETED THERAPY • RECRUITING 11

A Study of Amivantamab and FOLFIRI Versus Cetuximab/Bevacizumab and FOLFIRI in Participants With KRAS/NRAS and BRAF Wild-type Colorectal Cancer Who Have Previously Received Chemotherapy

This clinical trial is testing the efficacy of amivantamab combined with FOLFIRI chemotherapy compared to cetuximab or bevacizumab with FOLFIRI in patients with KRAS/NRAS and BRAF wild-type colorectal cancer who have previously undergone chemotherapy. The intervention involves the biological agents amivantamab, cetuximab, and bevacizumab, along with the chemotherapy drugs 5-fluorouracil and leucovorin, which are important for evaluating progression-free survival and overall survival in this patient population. This is a Phase 3 trial currently recruiting 700 participants, which indicates that it is in the later stages of testing and aims to provide more definitive evidence regarding treatment effectiveness. Eligibility criteria include specific biomarker requirements related to KRAS, NRAS, and BRAF status, among others.

NCT: NCT06750094 · Enrollment: 700 · Sites: Abilene, Ann Arbor, Arlington, Athens, Atlanta

MEDIUM PHASE3 Stage III MSI/MMR TARGETED THERAPY • RECRUITING 11

A Study of Neoadjuvant QL1706 in Participants With Untreated dMMR/MSI-H Resectable Colon Cancer

This clinical trial is testing the efficacy of neoadjuvant QL1706 in participants with untreated, resectable colon cancer characterized by microsatellite instability high (MSI-H) or defective mismatch repair (dMMR). The intervention involves administering QL1706 alongside CAPEOX/Capecitabine to assess its impact on tumor response prior to surgery. This is a Phase 3 trial currently recruiting 363 participants, which indicates that it is in the later stages of testing and may provide critical data on treatment effectiveness for patients. Eligibility criteria include having untreated T4N0 or Stage III colon cancer with specific biomarker characteristics (MSI-H/dMMR).

NCT: NCT06686576 · Enrollment: 363 · Sites: Guangzhou, China

MEDIUM PHASE3 Stage III MSI/MMR TARGETED THERAPY • RECRUITING 11

Adjuvant PD-1 Blockade for High-risk Stage-II DMMR/MSI-H Colorectal Cancer

This phase III clinical trial is investigating the efficacy of Tislelizumab, a PD-1 blockade drug, as adjuvant therapy for patients with high-risk stage II dMMR/MSI-H colorectal cancer. The trial aims to assess how two cycles of Tislelizumab combined with standard adjuvant chemotherapy compare to standard care in improving disease-free survival (DFS). Currently, the trial is recruiting 180 participants, which means eligible patients may have the opportunity to receive this investigational treatment while contributing to important research. Eligibility criteria include the presence of specific biomarkers such as MSI, MSI-H, MMR, and DMMR.

NCT: NCT06520683 · Enrollment: 180 · Sites: Guangzhou, China

MEDIUM PHASE3 Stage IV KRAS TARGETED THERAPY • RECRUITING 11

A Study of Amivantamab and mFOLFOX6 or FOLFIRI Versus Cetuximab and mFOLFOX6 or FOLFIRI as First-line Treatment in Participants With KRAS/NRAS and BRAF Wild-type Unresectable or Metastatic Left-sided Colorectal Cancer

This clinical trial is testing the effectiveness of amivantamab in combination with standard chemotherapy (mFOLFOX6 or FOLFIRI) compared to cetuximab with the same chemotherapy regimen in adults with KRAS, NRAS, and BRAF wild-type unresectable or metastatic left-sided colorectal cancer. The intervention involves the biological agents amivantamab and cetuximab, which are being evaluated for their impact on progression-free survival (PFS). This is a Phase 3 trial currently recruiting 1,000 participants, which means eligible patients may have the opportunity to receive either treatment while contributing to important research on their effectiveness. Eligibility criteria include specific biomarker requirements related to KRAS, NRAS, BRAF, and other markers such as MSI and MMR status.

NCT: NCT06662786 · Enrollment: 1000 · Sites: Abilene, Albuquerque, Ann Arbor, Arlington, Arlington Heights

SIGNAL PHASE3 Stage III ctDNA LIQUID BIOPSY • RECRUITING 11

ctDNA-guided Selection of Adjuvant Chemotherapy Regimens for Elderly Colon Cancer Patients After Surgery: A Single-center, Randomized, Controlled Study

This clinical trial is testing the effectiveness of ctDNA-guided selection of adjuvant chemotherapy regimens in elderly patients with high-risk stage II and stage III colon cancer following surgery. Participants will receive either 6 months of 5-FU monotherapy or an intensive XELOX treatment regimen, which is significant for tailoring chemotherapy based on ctDNA detection. Currently in Phase 3 and actively recruiting, this trial aims to provide insights into disease-free survival outcomes for eligible patients. Eligibility criteria include being an elderly patient with high-risk stage II or stage III colon cancer and undergoing ctDNA testing post-surgery.

NCT: NCT06609551 · Enrollment: 312 · Sites: Hangzhou, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

Personalising and Refining Neo-adjuvant Chemotherapy in Locally Advanced but Resecable Colon Cancer in the Elderly of 70 Years Old or More

This clinical trial is testing the effectiveness of neoadjuvant chemotherapy using Folfox in elderly patients aged 70 years or older with locally advanced but resectable colon cancer. The intervention involves administering Folfox prior to surgery to potentially improve disease-free survival outcomes. This is a Phase 3 trial currently recruiting 150 participants, which means eligible patients may have the opportunity to receive this treatment while contributing to important research. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, and DMMR.

NCT: NCT06293625 · Enrollment: 150 · Sites: Dijon, France

MEDIUM PHASE2, PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

Sacituzumab Govitecan in Metastatic Colorectal Cancer

This clinical trial is testing the efficacy of Sacituzumab Govitecan (SG) in patients with metastatic colorectal cancer who have become refractory to at least two lines of standard chemotherapy and are not candidates for local therapy. The intervention involves administering SG compared to the physician's choice of treatment, which is significant as it may provide an alternative option for patients with limited treatment choices. This is a Phase II/III trial currently recruiting participants, indicating that patients may have the opportunity to access this investigational treatment while contributing to the research. Eligibility criteria include documented progression or intolerability to specific chemotherapy regimens and a minimum 6-month interval since the last use of Irinotecan.

NCT: NCT06243393 · Enrollment: 80 · Sites: Heidelberg, Germany

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING 11

Injection of SHR-A1811 Versus Physician Choiced Treatment in Patients With Advanced Colorectal Cancer Who Had Failed to Respond to Oxaliplatin, 5-fu, and Irinotecan

This clinical trial is testing the efficacy and safety of SHR-A1811 in patients with advanced colorectal cancer who have not responded to previous treatments with oxaliplatin, 5-FU, and irinotecan. The intervention involves the drug SHR-A1811, which is being compared to physician-chosen treatments such as TAS-102, regorafenib, and fruquintinib. This is a Phase 3 trial that is currently active but not recruiting, indicating that it is in the final stages of testing before potential approval, and patients may not be able to enroll at this time. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and RAS.

NCT: NCT06199973 · Enrollment: 130 · Sites: Shanghai, China

MEDIUM PHASE3 Stage IV KRAS TARGETED THERAPY • RECRUITING 11

Cadonilimab (AK104) Combined With Chemotherapy and Bevacizumab as First-line Treatment for RAS Mutated or Right Sided-metastatic MSS Colorectal Cancer

This clinical trial is testing the efficacy and safety of Cadonilimab (AK104) combined with chemotherapy and bevacizumab as a first-line treatment for patients with RAS mutated or right-sided metastatic microsatellite stable (MSS) colorectal cancer. The intervention involves the use of Cadonilimab, a drug that may enhance treatment outcomes when paired with standard chemotherapy and bevacizumab. This is a Phase 3 trial currently recruiting participants, which indicates that it is in the final stage of testing before potential approval, and patients may have the opportunity to access this treatment option. Eligibility criteria include specific biomarker requirements such as KRAS, NRAS, MSI, MSI-H, MMR, DMMR, and RAS mutations.

NCT: NCT06566755 · Enrollment: 30 · Sites: Shenyang, China

MEDIUM PHASE3 Stage III MSI/MMR TARGETED THERAPY • RECRUITING 11

Study of Perioperative Dostarlimab in Participants With Untreated T4N0 or Stage III dMMR/MSI-H Resectable Colon Cancer

This clinical trial is testing the efficacy of perioperative dostarlimab in participants with untreated T4N0 or Stage III dMMR/MSI-H resectable colon cancer. The intervention involves dostarlimab, a biological therapy, in combination with standard chemotherapy regimens CAPEOX and FOLFOX, which is significant for its potential to improve event-free survival compared to standard care. This is a Phase 3 trial currently recruiting 892 participants, indicating that patients may have the opportunity to access this treatment while contributing to important research. Eligibility criteria include the presence of specific biomarkers such as MSI, MSI-H, MMR, and DMMR.

NCT: NCT05855200 · Enrollment: 892 · Sites: Akron, Ann Arbor, Appleton, Baton Rouge, Bethesda

MEDIUM PHASE3 Stage III MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING 11

A Clinical Trial Evaluating the Efficacy and Safety of IBI310 in Combination With Sintilimab, for Neoadjuvant Treatment of MSI-H/dMMR Resectable Colon Cancer

This clinical trial is evaluating the efficacy and safety of IBI310 in combination with Sintilimab for patients with MSI-H/dMMR resectable colon cancer. The intervention involves the use of IBI310, a CTLA-4 antibody, alongside Sintilimab, which is significant for its potential to enhance treatment outcomes in this specific cancer type. This is a Phase 3 trial that is currently active but not recruiting, indicating that it is in the final stages of testing before potential approval, and patients may not be able to enroll at this time. Eligibility criteria include the presence of specific biomarkers such as MSI, MSI-H, MMR, and dMMR.

NCT: NCT05890742 · Enrollment: 453 · Sites: Guangzhou, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

Preoperative Short-course Radiation Followed by Envafolimab Plus CAPEOX for MSS Locally Advanced Rectal Adenocarcinoma

This clinical trial is testing the combination of preoperative short-course radiation followed by Envafolimab and CAPEOX chemotherapy in patients with microsatellite stable (MSS) locally advanced rectal adenocarcinoma. The intervention involves the use of Envafolimab, a PD-L1 monoclonal antibody, which is being evaluated for its potential to enhance the effectiveness of short-course radiotherapy and chemotherapy. This is a Phase 3 trial currently recruiting participants, which means eligible patients may have the opportunity to access this investigational treatment while contributing to the understanding of its efficacy and safety. Eligibility criteria include specific biomarker assessments such as MSI, MMR, and RAS status.

NCT: NCT05752136 · Enrollment: 108 · Sites: Hangzhou, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

Total Neoadjuvant Treatment ±Immunotherapy for High Risk Locally Advanced Rectal Cancer (TNTi)

The TNTi clinical trial is testing the effectiveness of total neoadjuvant treatment with and without the immunotherapy drug Camrelizumab for patients with high-risk locally advanced rectal cancer. This intervention is significant as it aims to determine the pathologic complete response (PCR) rate, which is a critical measure of treatment effectiveness. Currently in Phase 3 and actively recruiting 472 participants, this trial may provide insights into treatment options for patients facing this diagnosis. Eligibility criteria include specific biomarkers such as MSI, MMR, DMMR, RAS, and microsatellite status.

NCT: NCT06229041 · Enrollment: 472 · Sites: Beijing, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING 11

A Study of HX008 Compared to Chemotherapy in the First-Line Treatment of Subjects With MSI-H/dMMR Metastatic Colorectal Cancer

This clinical trial is testing the efficacy of HX008 (Pucotenlimab) compared to Investigator's Choice Chemotherapy in patients with metastatic colorectal cancer characterized by Microsatellite Instability High (MSI-H) or Mismatch Repair Deficient (dMMR). The intervention, HX008, is being evaluated for its potential clinical benefit in improving progression-free survival (PFS) in this specific patient population. This is a Phase 3 trial that is currently active but not recruiting, indicating that it is in the final stages of testing before potential approval, and patients are not currently being enrolled. Eligibility criteria include the presence of biomarkers such as MSI, MSI-H, MMR, dMMR, and RAS.

NCT: NCT05652894 · Enrollment: 190 · Sites: Beijing, China, Bengbu, China, Changchun, China, Changde, China, Changsha, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING 11

Study of XL092 + Atezolizumab vs Regorafenib in Participants With Metastatic Colorectal Cancer

This clinical trial is testing the combination of XL092 and atezolizumab against regorafenib in participants with metastatic colorectal cancer who have progressed during, after, or are intolerant to standard-of-care therapy. The intervention involves the use of XL092 and atezolizumab, which may provide a different therapeutic approach compared to regorafenib. This is a Phase 3 trial that is currently active but not recruiting, indicating that it is in the final stages of testing and may soon provide important data on treatment efficacy. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, RAS, and microsatellite status.

NCT: NCT05425940 · Enrollment: 901 · Sites: Albuquerque, Billings, Charlotte, Chattanooga, Cincinnati

MEDIUM PHASE2, PHASE3 Stage IV BRAF TARGETED THERAPY • ACTIVE_NOT_RECRUITING 11

A Study of a Patient-Specific Neoantigen Vaccine in Combination With Immune Checkpoint Blockade for Patients With Metastatic Colorectal Cancer

This clinical trial is testing a patient-specific neoantigen vaccine in combination with immune checkpoint blockade for patients with metastatic colorectal cancer. The intervention includes GRT-C901, GRT-R902, Atezolizumab, Ipilimumab, and fluoropyrimidine plus leucovorin, aiming to evaluate their effectiveness in improving molecular response and progression-free survival. The trial is currently in Phase 2 and Phase 3 and is active but not recruiting, meaning that while the study is ongoing, no new participants are being enrolled at this time. Eligibility criteria include specific biomarkers such as BRAF, MSI, MMR, and RAS status.

NCT: NCT05141721 · Enrollment: 700 · Sites: Austin, Bethesda, Boca Raton, Charlottesville, Chicago

MEDIUM PHASE3 Stage III MSI/MMR TARGETED THERAPY • RECRUITING 11

PACE: PD-1 Antibody For dMMR/MSI-H Stage III Colorectal Cancer

The PACE trial is investigating the efficacy of the PD-1 antibody Sintilimab in patients with dMMR/MSI-H Stage III colorectal cancer. Participants will receive either Sintilimab alone or a combination of oxaliplatin and capecitabine, which are standard chemotherapy agents, to assess their impact on disease-free survival. This is a Phase III study currently recruiting 323 participants, which means eligible patients may have the opportunity to receive a potentially effective treatment while contributing to important research. Eligibility criteria include having local advanced colon cancer with specific biomarker characteristics such as dMMR or MSI-H.

NCT: NCT05236972 · Enrollment: 323 · Sites: Guangzhou, China

MEDIUM PHASE3 Stage III MSI/MMR TARGETED THERAPY • RECRUITING 11

Neoadjuvant FOLFOXIRI Versus Immediate Surgery for Stage II and III Colon Cancers

This clinical trial is testing the effectiveness of neoadjuvant chemotherapy with the FOLFOXIRI regimen compared to immediate surgery for patients with high-risk stage II and III colon cancer. The intervention involves administering chemotherapy before surgery to potentially improve disease-free survival by reducing tumor size and minimizing the risk of metastasis. This is a Phase 3 trial currently recruiting 840 participants, which means eligible patients may have the opportunity to receive a treatment that could enhance their outcomes compared to standard care. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, and DMMR.

NCT: NCT05194878 · Enrollment: 840 · Sites: Guangzhou, China

MEDIUM PHASE3 Stage IV BRAF TARGETED THERAPY • ACTIVE_NOT_RECRUITING 11

A Study of Anlotinib Hydrochloride Capsule Combined With Chemotherapy as First-line Treatment in Subjects With RAS/BRAF Wild Metastatic Colorectal Cancer

This clinical trial is testing the combination of Anlotinib hydrochloride capsules with chemotherapy as a first-line treatment for patients with RAS/BRAF wild-type unresectable metastatic colorectal cancer. The intervention involves administering Anlotinib alongside standard chemotherapy agents Bevacizumab, Oxaliplatin, and Capecitabine, which is significant for evaluating potential improvements in treatment outcomes. Currently, the trial is in Phase 3 and is active but not recruiting, indicating that it is in the final stages of testing before potential approval. Eligibility criteria include specific biomarker requirements related to BRAF, MSI, MMR, and RAS status.

NCT: NCT04854668 · Enrollment: 748 · Sites: Beijing, China, Changchun, China, Changsha, China, Changzhi, China, Changzhou, China

MEDIUM PHASE2, PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

A Clinical Study to Evaluate Efficacy and Safety of Serplulimab (HLX10) Combined With Bevacizumab (HLX04) and Chemotherapy (XELOX) in Patients With Metastatic Colorectal Cancer (mCRC)

This clinical trial is evaluating the efficacy and safety of Serplulimab (HLX10) combined with Bevacizumab (HLX04) and chemotherapy (XELOX) in patients with metastatic colorectal cancer (mCRC). The intervention involves the use of HLX10, a drug that is being tested against a placebo to determine its effectiveness in improving patient outcomes. Currently, the trial is in Phase 2 and Phase 3 and is actively recruiting participants, which means eligible patients may have the opportunity to receive this treatment as part of the study. Eligibility criteria include the presence of specific biomarkers, such as MSI or MSI-H.

NCT: NCT04547166 · Enrollment: 568 · Sites: Guangzhou, China, Hangzhou, China, Kashiwa, Japan, Linyi, China, Shanghai, China

MEDIUM PHASE3 Stage IV BRAF TARGETED THERAPY • ACTIVE_NOT_RECRUITING 11

A Study of Encorafenib Plus Cetuximab With or Without Chemotherapy in People With Previously Untreated Metastatic Colorectal Cancer

This clinical trial is evaluating the effectiveness of encorafenib plus cetuximab, with or without standard chemotherapy, in patients with previously untreated metastatic colorectal cancer that has a BRAF mutation. The intervention involves administering encorafenib orally and cetuximab via intravenous infusion, either alone or in combination with chemotherapy agents such as oxaliplatin and irinotecan. This is a Phase 3 trial that is currently active but not recruiting, indicating that it is in the final stages of testing before potential approval, and patients may not be able to enroll at this time. Eligibility criteria include having a BRAF mutation and being treatment-naive for metastatic colorectal cancer.

NCT: NCT04607421 · Enrollment: 831 · Sites: Aventura, Basking Ridge, Berkeley Heights, Chicago, City of Saint Peters

MEDIUM PHASE3 Stage III MSI/MMR LIQUID BIOPSY • RECRUITING 11

Circulating Tumour DNA Based Decision for Adjuvant Treatment in Colon Cancer Stage II Evaluation

The CIRCULATE study is evaluating adjuvant therapy for patients with UICC stage II colon cancer. The intervention involves the use of capecitabine to assess its impact on disease-free survival in patients who test positive for postoperative circulating tumor DNA. This is a Phase 3 trial that is currently recruiting participants, which means eligible patients may have the opportunity to receive capecitabine as part of their treatment. Eligibility criteria include specific biomarker assessments such as MSI, MMR, and RAS status.

NCT: NCT04089631 · Enrollment: 4812 · Sites: Dresden, Germany

MEDIUM PHASE3 Stage IV BRAF LIQUID BIOPSY • RECRUITING 11

Identification and Treatment Of Micrometastatic Disease in Stage III Colon Cancer

This clinical trial is testing various treatment options for patients with Stage III colon cancer who have micrometastatic disease. The interventions include the FOLFIRI protocol, Nivolumab, Encorafenib/Binimetinib/Cetuximab, Trastuzumab + Pertuzumab, and active surveillance, which are being evaluated to determine their effectiveness in improving disease-free survival (DFS). Currently in Phase 3 and actively recruiting, this trial aims to enroll 400 participants, providing an opportunity for patients to receive standard care based on specific blood test results. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, MMR, DMMR, HER2, CTDNA, and RAS.

NCT: NCT03803553 · Enrollment: 400 · Sites: Boston, New York

Testing the Addition of Atezolizumab to Combination Chemotherapy or Atezolizumab Alone for Metastatic Colon or Rectal Cancer, the COMMIT Study

The COMMIT study is a phase III clinical trial evaluating the effectiveness of adding atezolizumab to combination chemotherapy or administering atezolizumab alone in patients with metastatic colorectal cancer characterized by deficient DNA mismatch repair. The intervention involves the use of atezolizumab, a monoclonal antibody that may enhance the immune system's ability to combat cancer, alongside standard chemotherapy agents like fluorouracil and bevacizumab, which target tumor growth and blood vessel formation. Currently, the trial is active but not recruiting new participants, indicating that it is in the process of collecting data from enrolled patients. Eligibility criteria include specific biomarkers such as MSI, MMR, and RAS, which are essential for determining the suitability of patients for this treatment approach.

NCT: NCT02997228 · Enrollment: 120 · Sites: Aberdeen, Akron, Albany, Albuquerque, Allentown

SIGNAL PHASE3 Stage IV BRAF RESEARCH • RECRUITING 9

Intermittent or Continuous Panitumumab Plus FOLFIRI for Left Sided RAS/B-RAF Wild-type Metastatic Colorectal Cancer

This clinical trial is testing the effectiveness of intermittent versus continuous administration of Panitumumab combined with FOLFIRI in patients with left-sided RAS/B-RAF wild-type metastatic colorectal cancer. The intervention involves the use of Panitumumab, Irinotecan, 5-fluorouracil, and L-folinic acid, which are important for evaluating treatment strategies that may optimize patient outcomes. Currently in Phase 3 and actively recruiting, this trial aims to determine if the intermittent regimen can achieve a Time to Treatment Failure comparable to the standard continuous regimen. Eligible participants must have tumors that are RAS/B-RAF wild-type and may undergo additional biomarker assessments to inform treatment personalization.

NCT: NCT06509126 · Enrollment: 500 · Sites: Naples, Italy

MEDIUM PHASE2 Stage IV BRAF TARGETED THERAPY • RECRUITING 9

A Study To Evaluate The Efficacy And Safety Of Ifinatamab Deruxtecan (I-DXd) In Subjects With Recurrent Or Metastatic Solid Tumors (IDeate-PanTumor02)

This clinical trial is evaluating the efficacy and safety of ifinatamab deruxtecan (I-DXd) in patients with recurrent or metastatic solid tumors, including colorectal cancer. The intervention, ifinatamab deruxtecan, is a drug that targets specific biomarkers, which may be significant for treatment outcomes. This is a Phase 2 trial currently recruiting 520 participants, indicating that patients may have the opportunity to access this investigational therapy while contributing to the understanding of its effectiveness. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, MMR, DMMR, HER2, and RAS.

NCT: NCT06330064 · Enrollment: 520 · Sites: Amarillo, Chattanooga, Dallas, Fairfax, Germantown

Testing Pump Chemotherapy in Addition to Standard of Care Chemotherapy Versus Standard of Care Chemotherapy Alone for Patients With Unresectable Colorectal Liver Metastases: The PUMP Trial

The PUMP trial is testing the effectiveness of hepatic arterial infusion (HAI) chemotherapy in addition to standard of care chemotherapy for patients with unresectable colorectal liver metastases. The intervention involves administering the chemotherapy drug floxuridine directly into the liver via a catheter, which may enhance treatment efficacy compared to standard chemotherapy alone. This is a phase III trial currently recruiting 408 participants, which means eligible patients have the opportunity to receive a potentially more effective treatment option while contributing to important research. Eligibility criteria include specific biomarkers such as MSI, MSI-H, RAS, and microsatellite status.

NCT: NCT05863195 · Enrollment: 408 · Sites: Allentown, Ann Arbor, Atlanta, Aurora, Aventura

SIGNAL PHASE3 Stage III RESEARCH • RECRUITING 9

Adjuvant Chemotherapy Combined With Targeted Therapy or Not in the T3-4N2 Colorectal Cancer Patients

This clinical trial is testing the effectiveness of adjuvant chemotherapy combined with targeted therapy in patients with resectable stage T3-4N2 colorectal cancer. The intervention involves FOLFOX chemotherapy regimens with or without Bevacizumab, which is significant for evaluating potential improvements in disease-free survival. This is a Phase 3 trial currently recruiting 366 participants, which means eligible patients may have the opportunity to contribute to important findings regarding treatment options. Specific eligibility criteria or biomarker requirements have not been detailed in the provided information.

ctDNA-guided Adjuvant Chemotherapy in Liver Metastasis of Colorectal Cancer

This clinical trial is testing the effectiveness of ctDNA-guided adjuvant chemotherapy in patients with resectable colorectal cancer liver metastasis. The intervention involves colorectal cancer resection combined with liver metastasis resection, followed by the FOLFOX chemotherapy regimen, to determine its impact on 3-year progression-free survival. Currently in Phase 3 and actively recruiting, this trial aims to provide insights into whether adjuvant chemotherapy offers benefits over a "watching and waiting" strategy for ctDNA-negative patients. Eligibility criteria include being ctDNA-negative after resection of colorectal cancer liver metastasis.

NCT: NCT05815082 · Enrollment: 490 · Sites: Guangzhou, China

SIGNAL PHASE3 Stage III ctDNA LIQUID BIOPSY • RECRUITING 9

Platform Study of Circulating Tumor DNA Directed Adjuvant Chemotherapy in Colon Cancer (KCSG CO22-12)

The KCSG CO22-12 trial is testing the effectiveness of intensified chemotherapy in patients with stage 2-3 colon cancer who have detectable circulating tumor DNA (ctDNA) during adjuvant treatment. The intervention involves a three-month regimen of modified FOLFIRINOX compared to standard FOLFOX or CAPOX chemotherapy, aiming to determine if this approach improves the three-year disease-free survival rate. This is a phase 3 clinical trial currently recruiting participants, which means eligible patients may have the opportunity to receive a potentially more effective treatment option. Eligibility criteria include having stage 2-3 colon cancer and positive ctDNA results during initial adjuvant chemotherapy.

NCT: NCT05534087 · Enrollment: 236 · Sites: Goyang, South Korea, Seongnam, South Korea, Seoul, South Korea

Combination of IV Ascorbic Acid and Adebrelimab in Metastatic Colorectal Cancer

This clinical trial is testing the combination of intravenous ascorbic acid, Adebrelimab, and the FOLFOX protocol in patients with metastatic colorectal cancer who have high expression of the GLUT3 biomarker. The intervention involves administering ascorbic acid alongside a PD-L1 antibody and standard chemotherapy, which may enhance treatment efficacy based on previous preclinical findings. This is a Phase 3 trial currently recruiting 400 participants, indicating that it is in the later stages of testing and may provide valuable information on the effectiveness of this combination therapy for patients. Eligibility criteria include having metastatic colorectal cancer with high GLUT3 expression.

NCT: NCT04516681 · Enrollment: 400 · Sites: Shanhai, China

Personalized Long-course Radiotherapy Plus Chemotherapy With or Without Immunotherapy for LARC: PALACE Study

The PALACE study is a phase III clinical trial designed for patients with locally advanced rectal cancer (LARC) to evaluate the complete response rate to personalized long-course radiotherapy combined with chemotherapy, with or without the anti-PD-1 antibody drug Serplulimab. This intervention is significant as it aims to determine the effectiveness of adding immunotherapy to standard treatment protocols. Currently, the trial is recruiting participants, which means eligible patients have the opportunity to join and contribute to the research. Eligibility criteria include specific biomarkers such as MMR and RAS.

NCT: NCT07020247 · Enrollment: 184 · Sites: Chengdu, China

QUILT-3.055: A Study of Combination Immunotherapies in Patients Who Have Previously Received Treatment With Immune Checkpoint Inhibitors

The QUILT-3.055 trial is investigating combination immunotherapies for patients with advanced solid tumors who have previously received treatment with immune checkpoint inhibitors. The intervention involves N-803 combined with various checkpoint inhibitors, including Pembrolizumab, Nivolumab, Atezolizumab, Avelumab, and Durvalumab, which is important for evaluating potential enhanced efficacy in this patient population. This is a Phase 2 study that is currently active but not recruiting, meaning that while the trial is ongoing, no new participants are being enrolled at this time. Eligibility criteria include specific biomarkers such as KRAS, BRAF, HER2, NTRK, and RAS.

NCT: NCT03228667 · Enrollment: 40 · Sites: Anchorage, Billings, Boston, Buffalo, Charleston

Study to Evaluate the Efficacy of FOLFOX + Panitumumab Followed by FOLFIRI + Bevacizumab (Sequence 1) Versus FOLFOX + Bevacizumab Followed by FOLFIRI + Panitumumab (Sequence 2) in Untreated Patients With Wild-type RAS Metastatic, Primary Left-sided, Unresectable Colorectal Cancer

This clinical trial is evaluating the efficacy of two treatment sequences for untreated patients with wild-type RAS metastatic, primary left-sided, unresectable colorectal cancer. The interventions being tested are FOLFOX combined with panitumumab followed by FOLFIRI with bevacizumab (Sequence 1) versus FOLFOX with bevacizumab followed by FOLFIRI with panitumumab (Sequence 2). This is a Phase 3 trial that is currently active but not recruiting, indicating that it is in the later stages of testing and may provide insights into treatment effectiveness for eligible patients. Eligibility criteria include the presence of wild-type RAS biomarkers, specifically KRAS and NRAS.

Bovine Reinforcement in Stomach, Colorectal and Lung Operation

This clinical trial is testing the effectiveness of a bioabsorbable staple line reinforcement device in patients undergoing stomach, colorectal, and lung surgeries. The intervention aims to reduce the incidence of postoperative hemorrhage and anastomotic leakage compared to standard non-reinforced techniques. Currently in Phase 3 and actively recruiting, this trial seeks to enroll 172 participants, which may provide insights into surgical outcomes for patients. Specific eligibility criteria or biomarker requirements have not been detailed in the provided information.

NCT: NCT06968221 · Enrollment: 172 · Sites: Shanghai, China

SIGNAL PHASE3 All Stages RAS RESEARCH • RECRUITING 7

The Effect of Discontinuation of Renin Angiotensin System Inhibitors on the Perioperative Myocardial Injury in Adult Patients Undergoing Colorectal Cancer Surgery

This clinical trial is testing the effect of discontinuing Renin Angiotensin System (RAS) inhibitors in adult patients undergoing colorectal cancer surgery. The intervention involves the use of ACE inhibitors and/or angiotensin receptor blockers (ARBs) to assess their impact on perioperative myocardial injury, which is significant for managing cardiovascular risks during surgery. This is a Phase 3 trial currently recruiting 156 participants, indicating that patients may have the opportunity to contribute to important findings that could influence clinical practices. Eligibility criteria include the presence of specific biomarkers related to the RAS.

NCT: NCT06862115 · Enrollment: 156 · Sites: Cairo, Egypt

DEBIRI Plus Chemotherapy vs. Chemotherapy Alone in Colorectal Cancer Liver Metastases

This clinical trial is testing the effectiveness of DEBIRI combined with chemotherapy compared to chemotherapy alone in patients with colorectal cancer liver metastases. The intervention involves the use of Drug-Eluting Embolic Beads (DEBIRI) alongside systemic chemotherapy, which may enhance tumor shrinkage and increase the chances of surgical resection. This is a Phase 3 trial currently recruiting 116 participants, indicating that patients may have the opportunity to access this treatment while the study is ongoing. Eligible participants must be chemotherapy-naïve for their metastatic disease and may need to meet specific biomarker criteria related to RAS.

NCT: NCT06555003 · Enrollment: 116 · Sites: Tehran, Iran

SIGNAL PHASE3 Stage IV MSI/MMR RESEARCH • RECRUITING 7

mFOLFOX6 + Bevacizumab + PD-1 Monoclonal Antibody Vs. mFOLFOX6 in Locally Advanced pMMR/MSS CRC

This clinical trial is testing the combination of mFOLFOX6, Bevacizumab, and a PD-1 monoclonal antibody in patients with locally advanced mismatch repair-proficient or microsatellite stable colorectal cancer (pMMR/MSS CRC). The intervention aims to enhance the efficacy of immunotherapy in this patient population, which has shown limited response to PD-1 monoclonal antibodies alone. Currently in Phase 3 and actively recruiting, this trial seeks to determine the three-year disease-free survival (DFS) rate, providing critical insights for future treatment strategies. Eligibility criteria include specific biomarker assessments such as MMR, RAS, and microsatellite status, which are essential for patient selection.

NCT: NCT06791512 · Enrollment: 166 · Sites: Guangzhou, China

A Study of Tucidinostat in Combination With Sintilimab and Bevacizumab in MSS/pMMR Colorectal Cancer Patients

This clinical trial is testing the combination of tucidinostat, sintilimab, and bevacizumab in patients with MSS/pMMR colorectal cancer. The intervention aims to evaluate the efficacy and safety of this combination compared to fruquintinib monotherapy, which is significant for understanding potential treatment options for this patient population. Currently in Phase 3 and actively recruiting, this trial may provide insights into overall survival outcomes for participants. Eligibility criteria include specific biomarkers such as KRAS, MSI, MMR, and RAS.

NCT: NCT06497985 · Enrollment: 430 · Sites: Guangzhou, China

SIGNAL PHASE3 Stage IV BRAF RESEARCH • RECRUITING 7

Induction Treatment for Initially Unresectable Colorectal Liver Metastases: Combined Hepatic Arterial Infusion Pump Therapy With Systemic Therapy

This clinical trial is testing the effectiveness of combined Hepatic Arterial Infusion Pump therapy with systemic therapy in patients with initially unresectable colorectal liver metastases. The intervention involves intra-arterial infusion of Floxuridine (FUDR) alongside standard systemic therapy, which may enhance treatment outcomes for this patient population. Currently in Phase 3 and actively recruiting, this trial aims to determine if the combined approach improves overall survival compared to systemic therapy alone. Eligibility criteria include being chemotherapy-naive and having specific biomarkers such as BRAF, MMR, and RAS.

NCT: NCT06857773 · Enrollment: 306 · Sites: Amsterdam, Netherlands

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 7

HDAC Inhibitor Combination With Chemoimmunotherapy in the Neoadjuvant Treatment of pMMR Locally Advanced Colon Cancer

This clinical trial is testing the safety and efficacy of an HDAC inhibitor, Chidamide, in combination with Tislelizumab and chemotherapy (CapeOX) for patients with locally advanced colon cancer that is proficient in mismatch repair (pMMR). The intervention aims to determine if this combination can improve the rate of pathological complete response (pCR) and complete resection compared to standard neoadjuvant therapy. Currently in Phase 2 and actively recruiting, this trial may provide insights into treatment options for eligible patients. Participants may need to meet specific biomarker criteria, including MSI, MSI-H, MMR, DMMR, and RAS status.

NCT: NCT06709885 · Enrollment: 100 · Sites: Chongqing, China

Phase I Study of [177Lu]Lu-NNS309 in Patients With Pancreatic, Lung, Breast and Colorectal Cancers

This clinical trial is testing the safety and efficacy of the drugs [177Lu]Lu-NNS309 and [68Ga]Ga-NNS309 in patients aged 18 years and older with locally advanced or metastatic pancreatic, lung, breast, and colorectal cancers. The intervention involves evaluating the dosimetry and imaging properties of these drugs, which is important for understanding their potential therapeutic benefits and safety profiles. This is a Phase I study that is currently recruiting participants, indicating that it is in the early stages of testing to assess safety and tolerability. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, HER2, and microsatellite status.

NCT: NCT06562192 · Enrollment: 162 · Sites: Birmingham, Boston, Grand Rapids, Houston, Jacksonville

SIGNAL PHASE2, PHASE3 All Stages RESEARCH • RECRUITING 7

Colon Cancer Diagnosis With FAPI-PET Imaging

This clinical trial is testing the diagnostic efficacy of 18F-FAPI-74 PET/CT imaging in patients with primary colon cancer. The intervention involves the use of a novel PET tracer, 18F-FAPI-74, which targets fibroblast activation protein overexpressed by cancer-associated fibroblasts, potentially improving the detection of local lymph node and distant metastases. Currently in Phase 2 and Phase 3, the trial is recruiting 100 patients, which means eligible participants may contribute to understanding the effectiveness of this imaging tool in clinical practice. Specific eligibility criteria have not been detailed, but the study focuses on patients diagnosed with colon cancer.

NCT: NCT07272772 · Enrollment: 100 · Sites: Turku, Finland

Node-sparing Short-Course Radiation Combined With CAPOX and Tislelizumab for MSS Rectal Cancer

This Phase III clinical trial is evaluating the effectiveness of node-sparing modified short-course radiation combined with CAPOX and Tislelizumab for patients with microsatellite stable (MSS) middle and low rectal cancer. The intervention involves a targeted radiation approach that spares surrounding tumor-draining lymph nodes, which may have implications for reducing treatment-related side effects while maintaining efficacy. Currently, the trial is active but not recruiting, meaning that while it is ongoing, no new participants are being enrolled at this time. Eligibility criteria include specific biomarkers such as microsatellite instability (MSI) and mismatch repair (MMR) status.

NCT: NCT06507371 · Enrollment: 170 · Sites: Hanzhou, China

MEDIUM NA Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING 7

Targeted Treatment Plus Tislelizumab and HAIC for Advanced CRCLM Failed From Standard Systemic Treatment

This clinical trial is testing the efficacy and safety of a combination of hepatic arterial infusion chemotherapy (HAIC), targeted therapy, and the PD-1 inhibitor tislelizumab for patients with advanced colorectal cancer liver metastasis (CRCLM) who have not responded to standard systemic treatment. The intervention aims to provide an individualized treatment regimen based on genotyping or ctDNA genotyping, which is significant for optimizing therapy in microsatellite stable (MSS) CRCLM cases. The trial is currently active but not recruiting new participants, indicating that it is in the process of evaluating its outcomes with the enrolled patients. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, HER2, and RAS.

NCT: NCT06199232 · Enrollment: 47 · Sites: Beijing, China

Evaluating Novel Therapies in ctDNA Positive GI Cancers

This clinical trial is evaluating the effectiveness of the drugs atezolizumab and bevacizumab in patients with ctDNA positive gastrointestinal (GI) cancers, specifically colorectal cancer, gastric cancer, pancreatic ductal adenocarcinoma (PDAC), and gallbladder adenocarcinomas. The intervention involves administering intravenous atezolizumab and bevacizumab to patients who have completed standard of care treatments but still test positive for ctDNA, which may indicate residual disease. This is a Phase 3 trial currently recruiting participants, meaning eligible patients may have the opportunity to access these therapies while contributing to the research. Eligibility criteria include having a histologically confirmed GI cancer, a positive SignateraTM ctDNA test, and being radiographically NED within a specified timeframe after completing curative-intent therapy.

NCT: NCT05482516 · Enrollment: 20 · Sites: Hackensack, Washington D.C.

SIGNAL PHASE3 Stage IV MSI/MMR RESEARCH • RECRUITING 7

Comparing Chidamide+Sintilimab+Bev With Standard Second-line FOLFIRI+Bev in Advanced MSS/pMMR mCRC

This clinical trial is testing the combination of chidamide, sintilimab, and bevacizumab against the standard second-line treatment of FOLFIRI plus bevacizumab in patients with advanced microsatellite stable (MSS) and proficient mismatch repair (pMMR) metastatic colorectal cancer (mCRC) who have not responded to first-line oxaliplatin-based therapy. The intervention involves an experimental drug regimen that may offer a different therapeutic approach compared to the standard treatment, which is important for improving patient outcomes. This is a Phase 3 trial currently recruiting participants, indicating that it is in the later stages of testing efficacy and safety before potential approval for broader use. Eligibility criteria include specific biomarkers such as MSI, MMR, RAS, and microsatellite status, which are essential for determining suitable candidates for the study.

NCT: NCT05768503 · Enrollment: 176 · Sites: Chengdu, China, Foshan, China, Guangzhou, China, Hangzhou, China, Harbin, China

A Study of 2nd-line FOLFIRI ± Bevacizumab vs. Irinotecan ± Bevacizumab in mCRC

This clinical trial is testing the effectiveness of second-line FOLFIRI with or without Bevacizumab compared to Irinotecan (CPT-11) with or without Bevacizumab in patients with metastatic colorectal cancer (mCRC). The intervention involves a combination of drugs, including Bevacizumab, CPT-11, 5-FU (both bolus and infusion), and l-LV, which are important for evaluating treatment options in this patient population. This is a Phase 3 trial currently recruiting 280 participants, which means eligible patients may have the opportunity to contribute to significant findings regarding treatment efficacy. Eligibility criteria may include specific biomarkers, although details on these requirements are not provided.

NCT: NCT03303495 · Enrollment: 280 · Sites: Guangzhou, China

EMB-01 in Combination With Chemotherapy for Unresectable or Metastatic Colorectal Cancer

This clinical trial is testing the safety and preliminary efficacy of EMB-01 in combination with various chemotherapy regimens for patients with unresectable or metastatic colorectal cancer. The intervention includes EMB-01 along with irinotecan, TAS-102, mFOLFOX6, and FOLFIRI, which is important for assessing potential new treatment combinations. This is a Phase Ib trial that is not yet recruiting, meaning patients will need to wait for enrollment to begin before participating. Eligibility may include specific biomarker requirements such as KRAS, NRAS, BRAF, HER2, NTRK, and RAS.

NCT: NCT07649655 · Enrollment: 120 ·

MEDIUM PHASE1, PHASE2 Stage IV MSI/MMR TARGETED THERAPY • NOT_YET_RECRUITING 6

A Clinical Study of TQB2930 Injection and Chemotherapy With or Without Bevacizumab in the Treatment of Advanced Colorectal Cancer

This clinical trial is testing the safety and preliminary efficacy of TQB2930 injection in combination with chemotherapy, with or without bevacizumab, for patients with HER2-positive unresectable locally advanced or metastatic colorectal cancer. The intervention involves administering TQB2930 alongside oxaliplatin and capecitabine, with the addition of bevacizumab for some participants, which may provide insights into treatment options for this specific patient population. The trial is currently in Phase 1 and Phase 2 and is not yet recruiting, meaning that patients will need to wait for enrollment to begin before they can participate. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, HER2, and microsatellite status.

NCT: NCT07653685 · Enrollment: 71 · Sites: Beijing, China, Changchun, China, Changsha, China, Harbin, China, Jingzhou, China

An Exploratory Study of Zanidatamab in HER2-positive Advanced Tumor After at Least One Line of Standard Therapy

This clinical trial is testing the efficacy of Zanidatamab in adults with HER2-positive advanced tumors who have received at least one line of standard therapy. The intervention involves administering Zanidatamab intravenously at a dosage of 20 mg/kg every two weeks, which is significant for evaluating its potential effectiveness in this patient population. This is a Phase 2 trial that is currently not yet recruiting, meaning patients will need to wait until enrollment begins to participate. Eligibility criteria include specific biomarkers such as HER2, BRAF, MSI, MSI-H, MMR, and DMMR.

NCT: NCT07631871 · Enrollment: 10 ·

MEDIUM PHASE2 Stage IV BRAF LIQUID BIOPSY • NOT_YET_RECRUITING 6

SBRT Followed by PD-1 Inhibitor, Bevacizumab and TAS-102 as Third-Line Therapy for Recurrent/Metastatic Colorectal Cancer

combination of SBRT and the specified drugs improves progression-free survival (PFS) in patients with recurrent or metastatic colorectal cancer (mCRC) who have already undergone at least two lines of systemic therapy. The intervention involves administering stereotactic body radiotherapy (SBRT) followed by the immune checkpoint inhibitor sintilimab, bevacizumab, and TAS-102, which may enhance treatment efficacy in this patient population. This is a Phase II trial that is not yet recruiting, meaning patients will need to wait until enrollment begins to participate. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, MMR, DMMR, ctDNA, microsatellite status, and mismatch repair status.

NCT: NCT07535632 · Enrollment: 58 · Sites: Shanghai, China

A Phase II Platform Study to Evaluate Treatment With Cemiplimab Monotherapy or Cemiplimab Plus Fianlimab or Other Novel Combinations in Patients With Colorectal Cancer With Minimal Residual Disease Following Definitive Surgery and Chemotherapy (EMPIRE)

The EMPIRE trial is evaluating the effectiveness of cemiplimab monotherapy and cemiplimab in combination with fianlimab or other novel therapies in patients with colorectal cancer who have minimal residual disease following definitive surgery and chemotherapy. The intervention involves immunotherapeutic drugs, which aim to enhance the immune system's ability to target and eliminate cancer cells, particularly in patients who are ctDNA-positive after treatment. This is a Phase II study currently recruiting participants, which means eligible patients may have the opportunity to receive these investigational treatments while contributing to the understanding of their effectiveness. Eligibility criteria include specific biomarkers such as MSI, MMR, and ctDNA status.

NCT: NCT07058012 · Enrollment: 79 · Sites: Gainesville, Iowa City, Kansas City, Kingsport, Midlothian

MEDIUM PHASE2 Stage IV BRAF TARGETED THERAPY • NOT_YET_RECRUITING 6

Testing Ivonescimab in Combination With Chemotherapy in Patients With Metastatic Colorectal Cancers Without Liver Metastases

This clinical trial is testing the efficacy of ivonescimab in combination with the FOLFIRI chemotherapy regimen in patients with metastatic colorectal cancer (mCRC) who do not have liver metastases. The intervention involves administering ivonescimab alongside FOLFIRI, comparing its effectiveness to the standard treatment of FOLFIRI combined with bevacizumab, with a focus on progression-free survival (PFS). This is a Phase 2 trial that is currently not yet recruiting, meaning patients will need to wait until enrollment begins to participate. Eligibility criteria include specific biomarkers such as BRAF, MSI, MMR, and RAS status, which will determine patient inclusion in the study.

Radiotherapy Plus CAPOX, and Iparomlimab and Tuvonralimab (QL1706) as Neoadjuvant Therapy for LARC

This clinical trial is testing the efficacy of radiotherapy combined with CAPOX, Iparomlimab, and Tuvonralimab (QL1706) as neoadjuvant therapy for patients with locally advanced rectal cancer (LARC). The intervention involves a combination of chemotherapy, immunotherapy, and radiotherapy, which may enhance treatment outcomes for this patient population. This is a Phase II trial that is not yet recruiting, meaning patients will need to wait until enrollment begins to participate.

Eligible participants must have locally advanced rectal cancer and may be assessed for specific biomarkers such as MSI, MSI-H, MMR, DMMR, and microsatellite status.

NCT: NCT07291401 · Enrollment: 108 · Sites: Wuhan, China

MEDIUM PHASE1, PHASE2 Stage IV KRAS TARGETED THERAPY • RECRUITING 6

A Study of ABT-301 Plus Tislelizumab With Bevacizumab in pMMR/Non-MSI-H Locally Advanced or mCRC

This clinical trial is testing the combination of ABT-301, Tislelizumab, and Bevacizumab in patients with locally advanced or metastatic colorectal cancer (mCRC) who have proficient mismatch repair (pMMR) and are non-MSI-H. The intervention involves escalating doses of ABT-301 alongside fixed doses of Tislelizumab and Bevacizumab, which is important for assessing safety and tolerability in this patient population. Currently in Phase 1 and Phase 2, the trial is actively recruiting participants, which means eligible patients may have the opportunity to receive this treatment regimen. Eligibility criteria include specific biomarker requirements such as KRAS, BRAF, and MMR status.

NCT: NCT07244705 · Enrollment: 66 · Sites: Clayton, Australia, Greenslopes, Australia, Heidelberg, Australia, Kaohsiung City, Taiwan, Liverpool, Australia

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • NOT_YET_RECRUITING 6

Neoadjuvant Therapy for Locally Advanced Low Rectal Cancer (SMARTi-RC01)

The SMARTi-RC01 clinical trial is investigating the effectiveness of combining serplulimab, a PD-1 inhibitor, with bevacizumab, short-course radiotherapy, and chemotherapy in adults with locally advanced mid-to-low rectal cancer. This trial aims to determine if the addition of bevacizumab enhances the complete remission rate compared to serplulimab combined with chemotherapy and radiotherapy alone, while also assessing the safety of these treatments. Currently in Phase 2 and not yet recruiting, this trial will enroll 138 participants, which means patients will need to wait until recruitment begins to potentially participate. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and microsatellite status.

NCT: NCT07134101 · Enrollment: 138 ·

MRD-guided Deferred Adjuvant Therapy in Resectable Early-stage Colon Cancer

This clinical trial is testing the use of minimal residual disease (MRD) status, detected by circulating tumor DNA (ctDNA), to guide adjuvant therapy decisions in patients with resectable early-stage colon cancer, specifically high-risk stage II and low-risk stage III. The interventions include standard CAPEOX adjuvant therapy, deferred CAPEOX adjuvant therapy, and intensive mFOLFOXIRI adjuvant therapy, which are significant for tailoring treatment based on individual MRD status. The trial is currently in the recruiting phase, meaning eligible patients can still enroll to participate in this study. Eligibility criteria include specific biomarker assessments such as MSI, MMR, and RAS status.

NCT: NCT06204484 · Enrollment: 349 · Sites: Guangzhou, China

A Phase 1-2 of ST316 With Selected Advanced Unresectable and Metastatic Solid Tumors

This clinical trial is testing the safety and efficacy of the drug ST316 in patients with selected advanced unresectable and metastatic solid tumors. The intervention involves administering ST316 alongside established treatments such as the FOLFIRI regimen, bevacizumab, Fruquintinib, and Lonsurf, which may provide insights into its potential benefits in this patient population. Currently in Phase 1 and actively recruiting participants, this trial aims to assess treatment-related adverse events and other pharmacological effects, which is crucial for determining the drug's safety profile. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and RAS, which may help identify suitable candidates for the study.

NCT: NCT05848739 · Enrollment: 130 · Sites: Birmingham, Boston, Denver, Durham, Grand Rapids

DETERMINE Trial Treatment Arm 05: Vemurafenib in Combination With Cobimetinib in Adult Patients With BRAF Positive Cancers.

The DETERMINE Trial Treatment Arm 05 is investigating the efficacy of the drug combination vemurafenib and cobimetinib in adult patients with BRAF positive cancers. This combination is already approved for treating unresectable or metastatic melanoma, and the trial aims to assess its effectiveness in other cancer types with the BRAF V600 mutation. Currently in Phase 2 and Phase 3, the trial is actively recruiting participants, which means eligible patients may have the opportunity to access this treatment option. Eligibility criteria include having a confirmed BRAF V600 mutation, assessed through next-generation sequencing (NGS).

NCT: NCT05768178 · Enrollment: 30 · Sites: Belfast, United Kingdom, Birmingham, United Kingdom, Bristol, United Kingdom, Cambridge, United Kingdom, Cardiff, United Kingdom

A Study Investigating the Efficacy and Safety of Alcestobart (LBL-007) Plus Tislelizumab in Combination With Bevacizumab Plus Fluoropyrimidine Versus Bevacizumab Plus Fluoropyrimidine in Participants With Unresectable or Metastatic Colorectal Cancer

This clinical trial is investigating the efficacy and safety of alcestobart (LBL-007) combined with tislelizumab, alongside bevacizumab and fluoropyrimidine, compared to bevacizumab and fluoropyrimidine alone in participants with unresectable or metastatic colorectal cancer. The intervention involves multiple drugs, which may provide insights into their combined effects on treatment outcomes. Currently, the trial is in Phase 1b/2 and is active but not recruiting, indicating that it is ongoing and may provide results in the future for patients with this condition. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, MMR, DMMR, RAS, and microsatellite status.

NCT: NCT05609370 · Enrollment: 113 · Sites: Albuquerque, Anchorage, Billings, Cerritos, Covington

The Possible Protective Role of Ketotifen Against Oxaliplatin Induced Peripheral Neuropathy

This clinical trial is evaluating the potential protective role of Ketotifen against oxaliplatin-induced peripheral sensory neuropathy in patients with stage III colorectal cancer. Participants will be randomized to receive either the modified FOLFOX-6 regimen with placebo tablets or the same regimen with Ketotifen oral tablets. This is a Phase 3 trial currently recruiting 64 patients, which means that it is designed to assess the efficacy and safety of Ketotifen in a larger population before it can be considered for broader use. Eligibility criteria include a diagnosis of stage III colorectal cancer and the ability to participate in the study's treatment regimen.

NCT: NCT05624138 · Enrollment: 64 · Sites: Tanta, Egypt

Circulating Tumor DNA Guided Adjuvant Chemotherapy for Colon Cancer

This clinical trial is testing the use of circulating tumor DNA (ctDNA) to guide adjuvant chemotherapy decisions for patients with stage III colon cancer. The intervention involves the detection of ctDNA, which is significant as it may help identify patients who can safely reduce chemotherapy without compromising their survival outcomes. The trial is currently in the recruiting phase, indicating that eligible patients can still enroll to participate in the study. Eligibility criteria include specific biomarkers such as BRAF, microsatellite instability (MSI), and mismatch repair (MMR) status, as well as the presence of circulating tumor DNA.

A Study to Learn About the Study Medicine Called PF-07799933 in People With Advanced Solid Tumors With BRAF Alterations.

This clinical trial is investigating the safety and effects of the study medicine PF-07799933 in individuals with advanced solid tumors that have BRAF alterations. The intervention includes PF-07799933 administered alone and in combination with other drugs such as binimetinib, cetuximab, midazolam, and fluorouracil, which is important for understanding potential treatment options for patients whose current therapies are ineffective. This is a Phase 1 trial currently recruiting participants, indicating that it is in the early stages of testing for safety and dosage. Eligible participants must have an advanced solid tumor with BRAF alterations and must have exhausted available treatment options.

NCT: NCT05355701 · Enrollment: 267 · Sites: Aurora, Miami, Nashville, New York, Newton

MEDIUM PHASE2 Stage III MSI/MMR TARGETED THERAPY • NOT_YET_RECRUITING 6

A Phase II Study of Tislelizumab as Adjuvant Therapy for Patients With Stage II and Stage III Colon Cancer and dMMR/MSI.

This Phase II clinical trial is testing the efficacy of Tislelizumab as adjuvant therapy for patients with Stage II and Stage III colon cancer characterized by deficient mismatch repair (dMMR) or microsatellite instability high (MSI-H). Tislelizumab is an anti-PD-1 antibody that may enhance the immune response against cancer cells, which is particularly relevant given the sensitivity of dMMR colon cancers to immune checkpoint inhibition. The trial is currently not yet recruiting participants, which means that patients interested in this study will need to wait until enrollment begins. Eligibility criteria include having high-risk Stage II or Stage III colon cancer with specific biomarkers such as dMMR, MSI-H, or other related mismatch repair characteristics.

NCT: NCT05231850 · Enrollment: 70 ·

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING 6

Testing Nivolumab and Ipilimumab With Short-Course Radiation in Locally Advanced Rectal Cancer

This phase II clinical trial is investigating the combination of nivolumab and ipilimumab with short-course radiation therapy in patients with locally advanced rectal cancer that has spread to nearby tissue or lymph nodes. The intervention involves the use of two immunotherapy drugs, nivolumab and ipilimumab, alongside radiation therapy, which may enhance the immune response against cancer cells while also targeting them directly with radiation. Currently, the trial is active but not recruiting new participants, indicating that it is ongoing with the existing enrolled patients. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, RAS, and microsatellite status.

NCT: NCT04751370 · Enrollment: 31 · Sites: Aberdeen, Altamonte Springs, Ames, Anchorage, Appleton

Chemotherapy Followed by Pelvic Reirradiation Versus Chemotherapy Alone as Pre-operative Treatment for Locally Recurrent Rectal Cancer

The GRECCAR 15 trial is testing the efficacy of neoadjuvant chemotherapy followed by pelvic reirradiation compared to neoadjuvant chemotherapy alone in patients with locally recurrent rectal cancer who have previously undergone pelvic radiotherapy. The intervention involves administering six cycles of the chemotherapy regimen FOLFIRINOX, followed by radiochemotherapy and subsequent surgery, which is significant for addressing the increased risk of non-curative resection in this patient population. This is a Phase 3 trial that is currently active but not recruiting, indicating that it is in the advanced stages of evaluation and may provide insights into treatment options for patients with this condition. Eligibility criteria include patients with a history of pelvic radiotherapy for primary rectal cancer and locally recurrent disease.

MEDIUM PHASE2 Stage III MSI/MMR TARGETED THERAPY • RECRUITING 6

Neoadjuvant Toripalimab With or Without Celecoxib in dMMR/MSI-H Colorectal Cancer

This clinical trial is investigating the effectiveness of neoadjuvant toripalimab, with or without celecoxib, in patients with mismatch repair-deficient (dMMR) or microsatellite instability-high (MSI-H) colorectal cancer. The intervention involves administering toripalimab, an anti-PD-1 immunotherapy, either alone or in combination with celecoxib for a total of 6 or 12 cycles, which is significant as these patients typically do not respond well to traditional chemotherapy. Currently in Phase 2 and actively recruiting, this trial aims to assess the pathological complete response (pCR) rates, which may inform treatment options for patients with this specific cancer subtype. Eligibility criteria include specific biomarker requirements such as dMMR, MSI-H, and RAS status.

Y-90, Capecitabine, and Atezolizumab for Oligometastatic CRC

The BrUOG-430 trial is evaluating the combination of yttrium-90 radioembolization, capecitabine, and atezolizumab for patients with unresectable colorectal cancer liver metastases who have previously received two or more lines of systemic therapy. This intervention aims to assess its preliminary efficacy based on the intrahepatic disease control rate at 12 weeks. Currently in Phase 2 and actively recruiting, this trial offers patients the opportunity to participate in a study that may provide insights into treatment effectiveness. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, TMB, RAS, and microsatellite status.

NCT: NCT06555133 · Enrollment: 18 · Sites: Providence

SIGNAL PHASE2 Stage III ctDNA LIQUID BIOPSY • RECRUITING 5

A Randomized Controlled Trial of Plasma ctDNA Methylation-Guided Adjuvant Chemotherapy Decision-Making in High-Risk Stage III (T4N+ or T1-3N2) Colorectal Cancer

This clinical trial is testing the effectiveness of plasma ctDNA methylation-guided adjuvant chemotherapy decision-making in patients with high-risk Stage III colorectal cancer (T4N+ or T1-3N2). The intervention involves administering either FOLFOX or FOLFOX plus bevacizumab for 6 months, which is significant for determining the optimal chemotherapy approach based on ctDNA levels. Currently in Phase 2 and actively recruiting, this trial aims to assess the impact of these treatments on patients' 2-year progression-free survival. Eligible participants will have specific disease characteristics and will undergo blood sample collection for ctDNA monitoring at various intervals post-surgery.

NCT: NCT07562490 · Enrollment: 100 · Sites: Shanghai, China

MEDIUM PHASE1 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 5

A Clinical Study to Evaluate the Safety and Tolerability of AWT020 in Patients With Advanced Malignancies

This clinical trial is evaluating the safety and tolerability of AWT020 in patients with advanced malignancies, including colorectal cancer. The intervention involves AWT020 used alone or in combination with other chemotherapy agents such as Taxol, Cisplatin, Carboplatin, Pemetrexed, Oxaliplatin, and Capecitabine, which is important for understanding its potential role in treatment regimens. Currently in Phase 1 and actively recruiting, this trial aims to assess the dose-limiting toxicity (DLT) rate, which is crucial for determining the safety profile of AWT020. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and RAS status.

NCT: NCT06839105 · Enrollment: 214 · Sites: Changchun, China, Changsha, China, Fuzhou, China, Guangzhou, China, Hangzhou, China

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 5

SCRT Combined With Chemotherapy and Iparomlimab and Tuvonralimab in MSS or pMMR Patients With Locally Advanced Rectal Cancer

This clinical trial is testing a novel neoadjuvant regimen for patients with locally advanced rectal cancer (LARC) classified as T3-4/N+ without distant metastasis. The intervention involves short-course radiotherapy followed by four cycles of CAPEOX combined with the drugs Iparomlimab and Tuvonralimab, aiming to improve organ preservation and treatment efficacy. Currently in Phase 2 and actively recruiting, this trial offers patients the opportunity to participate in a study that may enhance treatment outcomes for LARC. Eligibility criteria include patients with microsatellite stable (MSS) or mismatch repair proficient (pMMR) tumors, as well as specific biomarker assessments related to microsatellite instability and mismatch repair.

NCT: NCT06864013 · Enrollment: 116 · Sites: Hangzhou, China

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 5

Different Cycles of Preoperative Neoadjuvant Sintilimab in Mismatch-repair Deficient/microsatellite Instability-high, Locally Advanced Colorectal Cancer

This clinical trial is testing the efficacy of different cycles of preoperative neoadjuvant sintilimab in patients with mismatch-repair deficient/microsatellite instability-high, locally advanced colorectal cancer. The intervention involves the biological agent sintilimab, which is being evaluated for its potential to improve the pathological complete response rate (pCR) in this specific patient population. This is a Phase 2 trial that is currently recruiting participants, indicating that eligible patients may have the opportunity to receive this treatment as part of the study. Eligibility criteria include the presence of biomarkers such as MSI, MSI-H, MMR, DMMR, and microsatellite instability.

NCT: NCT06698757 · Enrollment: 96 · Sites: Zheng'zhou, China

SIGNAL PHASE2 Stage III ctDNA LIQUID BIOPSY ● RECRUITING 5

Randomized Trial of Plasma ctDNA Methylation-Guided Adjuvant Therapy in T4N0 and Low-Risk Stage III Colorectal Cancer

This clinical trial is testing the effectiveness of plasma ctDNA methylation-guided adjuvant therapy in patients with T4N0 and low-risk stage III colorectal cancer. The intervention involves the CAPEOX regimen, which is being evaluated for its impact on patient outcomes compared to a control group receiving a shorter duration of therapy. Currently in Phase 2 and actively recruiting, this trial aims to assess the primary outcome of patients' 2-year progression-free survival. Eligible participants will have specific criteria related to their cancer stage and may be monitored through blood samples for ctDNA analysis.

NCT: NCT07562503 · Enrollment: 340 · Sites: Shanghai, China

RESOLUTE Trial Aims to Investigate the Value of Adding Local Ablative Treatment to Standard Systemic Treatment for Unresectable Oligometastatic Colorectal Cancer

The RESOLUTE trial is investigating the clinical benefit of adding local ablative therapy to standard first-line systemic treatment for patients with unresectable oligometastatic colorectal cancer. The intervention involves local ablative therapy, which may enhance treatment outcomes by targeting metastatic lesions. This trial is currently active but not recruiting, indicating that while it is ongoing, no new participants are being enrolled at this time. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, MMR, DMMR, RAS, and microsatellite status.

NCT: NCT05862051 · Enrollment: 6 · Sites: Albury, Australia, Bendigo, Australia, Box Hill, Australia, Epping, Australia, Fitzroy, Australia

MEDIUM PHASE1 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 5

Study of Pembrolizumab Treatment After CYAD-101 With FOLFOX Preconditioning in Metastatic Colorectal Cancer

This clinical trial is testing the safety and clinical activity of CYAD-101 in patients with unresectable metastatic colorectal cancer, administered alongside FOLFOX chemotherapy and followed by pembrolizumab treatment. The intervention involves a combination of these three drugs, which is significant for understanding their potential effectiveness in this patient population. Currently in Phase 1 and actively recruiting participants, this trial aims to evaluate the occurrence of dose-limiting toxicities during the reporting period, which is crucial for determining the safety profile of the treatment regimen. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, RAS, and microsatellite status.

NCT: NCT04991948 · Enrollment: 34 · Sites: Jacksonville, Tampa

MEDIUM N/A All Stages ctDNA LIQUID BIOPSY • RECRUITING 5

ORACLE: Observation of ResiduAl Cancer With Liquid Biopsy Evaluation

The ORACLE trial is testing the ability of a novel ctDNA assay, Guardant Reveal, to detect recurrence in individuals who have been treated for early-stage solid tumors, specifically colorectal cancer. The intervention involves a liquid biopsy that analyzes circulating tumor DNA, which is important for monitoring potential cancer recurrence. This study is currently in the recruiting phase, indicating that eligible patients can still enroll to participate in the trial. Eligibility criteria include the requirement for biomarkers such as HER2 and the use of liquid biopsy for assessment.

NCT: NCT05059444 · Enrollment: 2020 · Sites: Appleton, Aurora, Birmingham, Boston, Broomall

MEDIUM NA Stage IV TARGETED THERAPY • ACTIVE_NOT_RECRUITING 5

Patient Reported Outcomes Study Using Electronic Monitoring System for Advanced or Metastatic Solid Cancer

This clinical trial is testing the effectiveness of electronic patient-reported outcomes (e-PRO) monitoring in patients with unresectable advanced cancers or metastatic/recurrent solid tumors receiving systemic drug therapy. The intervention involves the use of e-PRO monitoring to assess its impact on overall survival and health-related quality of life compared to usual care. The trial is currently active but not recruiting new participants, indicating that it is in the process of collecting data from enrolled patients. Eligibility criteria include patients with specific biomarkers, such as HER2, and a total enrollment of 500 participants is planned.

NCT: NCT05931445 · Enrollment: 500 · Sites: Kobe, Japan

MEDIUM N/A Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING 5

Retrospective Study on the Use of Immunotherapy in Patients With MSI-H Metastatic Colorectal Cancer

This clinical trial is a retrospective study examining the use of immunotherapy in patients with microsatellite instability-high (MSI-H) metastatic colorectal cancer (mCRC). The intervention involves the use of immune checkpoint inhibitors, specifically pembrolizumab and nivolumab, which are significant for their role in targeting the immune response against cancer cells. The trial is currently active but not recruiting, indicating that it is in the data collection phase, which may provide insights into treatment effectiveness for patients who have exhausted other options. Eligibility criteria include having MSI-H status, which is essential for determining the appropriateness of immunotherapy in this patient population.

NCT: NCT04612309 · Enrollment: 100 · Sites: Carpi, Italy

MEDIUM PHASE1, PHASE2 Stage IV BRAF TARGETED THERAPY • RECRUITING 5

BOLD-100 in Combination With FOLFOX for the Treatment of Advanced Solid Tumours

This clinical trial is testing the combination of BOLD-100 with FOLFOX chemotherapy for patients with advanced solid tumors. BOLD-100 is an intravenously administered small molecule that targets tumor cells by decreasing the expression of GRP78, which may enhance the effectiveness of FOLFOX. The trial is currently in Phase 1 and Phase 2 and is actively recruiting participants, indicating that patients may have the opportunity to receive this treatment while the study is ongoing. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, HER2, and microsatellite status.

NCT: NCT04421820 · Enrollment: 220 · Sites: Santa Monica, Tampa

MEDIUM PHASE2 Stage III MSI/MMR TARGETED THERAPY • RECRUITING 5

Neo-adjuvant Pembrolizumab and Radiotherapy in Localised MSS Rectal Cancer

This clinical trial is testing the combination of pembrolizumab and short course radiotherapy in patients with localized microsatellite stable (MSS) rectal cancer. The intervention involves administering pembrolizumab, an immunotherapy drug, alongside radiotherapy to evaluate its effects on tumor regression. This is a Phase 2 trial that is currently recruiting participants, which means eligible patients may have the opportunity to receive this treatment while contributing to the research. Eligibility criteria include having localized MSS rectal cancer and specific biomarker assessments related to microsatellite instability.

NCT: NCT04109755 · Enrollment: 25 · Sites: Geneva, Switzerland

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING 5

Pd1 Antibody Sintilimab ± Chemoradiotherapy for Locally Advanced Rectal Cancer

This clinical trial is testing the efficacy of the PD-1 antibody Sintilimab in combination with chemoradiotherapy for patients with locally advanced rectal cancer, specifically focusing on those with different MMR/MSI statuses. The intervention involves administering Sintilimab alongside oxaliplatin, capecitabine, and radiotherapy, which may influence treatment outcomes based on the tumor's biomarker profile. Currently in Phase 2 and marked as active but not recruiting, this trial is designed to evaluate the complete response rate among participants, providing insights into treatment effectiveness for this patient population. Eligibility criteria include specific biomarker requirements such as MMR, MSI, and RAS status.

NCT: NCT04304209 · Enrollment: 195 · Sites: Guangzhou, China

Study of IDE196 in Patients With Solid Tumors Harboring GNAQ/11 Mutations or PRKC Fusions

This clinical trial is evaluating the safety and anti-tumor activity of IDE196 in patients with solid tumors that have GNAQ or GNA11 mutations or PRKC fusions, including colorectal cancer. The intervention involves the drug IDE196, along with combinations of binimetinib and crizotinib, which are being tested to determine their effectiveness and safety profile. This is a Phase 1/2 study currently recruiting participants, which means eligible patients may have the opportunity to receive investigational treatments while contributing to research on their safety and efficacy. Eligibility criteria include the presence of specific biomarkers such as MSI, MSI-H, MMR, or DMMR.

NCT: NCT03947385 · Enrollment: 336 · Sites: Cincinnati, Cleveland, Denver, Durham, Grand Rapids

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 5

KN035 for dMMR/MSI-H Advanced Solid Tumors

This clinical trial is testing the efficacy of KN035 in patients with previously-treated locally-advanced or metastatic colorectal carcinoma and other solid tumors characterized by mismatched repair deficiency (dMMR) or microsatellite instability-high (MSI-H). The intervention involves KN035, a biological therapy, which is significant for its potential to target specific tumor characteristics. This is a Phase 2 trial currently recruiting 200 participants, indicating that patients may have the opportunity to access this treatment while contributing to the understanding of its effectiveness. Eligibility criteria include a requirement for colorectal cancer participants to have received prior standard therapies, while other solid tumor participants must have undergone at least one line of systemic standard of care therapy.

NCT: NCT03667170 · Enrollment: 200 · Sites: Beijing, China

MEDIUM PHASE2 Stage IV RAS IMMUNOTHERAPY • RECRUITING 5

Immunotherapy Using Tumor Infiltrating Lymphocytes for Patients With Metastatic Cancer

This clinical trial is testing an experimental immunotherapy using Tumor Infiltrating Lymphocytes (TIL) for adults aged 18-72 with metastatic cancers, specifically targeting those with digestive tract, urothelial, breast, or ovarian/endometrial tumors. The intervention involves the administration of Pembrolizumab (Keytruda), Fludarabine, Cyclophosphamide, Aldesleukin, and Young TIL, which are designed to enhance the body’s immune response against tumors. This is a Phase 2 trial currently recruiting participants, indicating that it is in the early stages of evaluating the treatment's effectiveness and safety. Eligibility criteria include adults with specific cancer types and a biomarker requirement related to RAS.

NCT: NCT01174121 · Enrollment: 332 · Sites: Bethesda

MEDIUM PHASE2 Stage III MSI/MMR TARGETED THERAPY ● RECRUITING ⚡ 4

A Phase II Trial of Neoadjuvant PD-1 Vaccine PD1-Vaxx in Operable MSI High Colorectal Cancer

This clinical trial is testing the neoadjuvant PD-1 vaccine IMU-201 (PD1-Vaxx) in patients with operable microsatellite instability-high (MSI-H) colorectal cancer. The intervention involves administering three doses of the PD1-Vaxx prior to surgical resection, with the goal of achieving a Major Pathological Response (MPR) defined as less than 10% viable tumor cells. This is a Phase II trial that is currently recruiting participants, which means eligible patients may have the opportunity to receive this treatment while contributing to the research. Eligibility criteria include having operable MSI-H colorectal cancer, with specific biomarker requirements such as MSI, MMR, and NGS.

NCT: NCT06692959 · Enrollment: 44 · Sites: Adelaide, Australia, Guildford, United Kingdom, Manchester, United Kingdom, Perth, Australia

Exploring Sintilimab + Bevacizumab + Decitabine for Advanced pMMR/MSS Colorectal Cancer (After 2+ Prior Therapies)

This clinical trial is investigating the efficacy and safety of a combination of sintilimab, bevacizumab, and decitabine for patients with advanced proficient mismatch repair/microsatellite stable (pMMR/MSS) colorectal cancer who have received two or more prior therapies. The intervention involves intravenous infusions of these three drugs administered in 3-week treatment cycles, which is important for assessing their combined impact on disease progression. This is a Phase 2 trial that is currently not yet recruiting, meaning patients will need to wait until enrollment begins to participate. Eligibility criteria include having advanced pMMR/MSS colorectal cancer and having undergone at least three prior lines of systemic therapy.

The INTRINSIC trial is evaluating the safety and efficacy of targeted therapies and immunotherapy in patients with metastatic colorectal cancer (mCRC) whose tumors are biomarker positive. The intervention includes several drugs: Inavolisib, Bevacizumab, Cetuximab, Atezolizumab, and Tiragolumab, which are being tested as single agents or in combination to determine their effectiveness. This is a Phase 1 study currently recruiting participants, which means it is in the early stages of testing to assess safety and initial efficacy. Eligible participants will be assigned to specific treatment arms based on their biomarker assay results.

NCT: NCT04929223 · Enrollment: 542 · Sites: Aurora, Baton Rouge, Birmingham, Boston, Detroit

MEDIUM PHASE1, PHASE2 All Stages IMMUNOTHERAPY • RECRUITING ⚡ 4

A Beta-only IL-2 ImmunoTherapY Study

This clinical trial is testing the safety and effectiveness of MDNA11, both as a monotherapy and in combination with Pembrolizumab (Keytruda®), for patients with advanced solid tumors. The intervention involves a dose-escalation and expansion study to determine the recommended doses for both monotherapy and combination therapy, which is important for optimizing treatment strategies. Currently in Phase 1/2 and actively recruiting, this trial offers patients the opportunity to participate in early-stage research that may inform future treatment options. Eligibility criteria may include specific biomarkers, although details are not provided.

NCT: NCT05086692 · Enrollment: 115 · Sites: Atlanta, Boca Raton, Detroit, Houston, San Diego

MEDIUM PHASE1, PHASE2 Stage IV IMMUNOTHERAPY • ACTIVE_NOT_RECRUITING ⚡ 4

Study of NGM707 As Monotherapy and in Combination with Pembrolizumab in Advanced or Metastatic Solid Tumor Malignancies

This clinical trial is investigating the efficacy of NGM707, both as a monotherapy and in combination with pembrolizumab (KEYTRUDA®), in patients with advanced or metastatic solid tumor malignancies, including colorectal cancer. The intervention involves administering NGM707 alone and in combination with pembrolizumab to assess its safety and potential effectiveness. Currently, the trial is in Phase 1 and Phase 2 and is active but not recruiting, indicating that it is ongoing but not accepting new participants at this time. Eligibility criteria may include specific biomarkers, although details on these requirements are not provided.

NCT: NCT04913337 · Enrollment: 179 · Sites: Albany, Baltimore, Blacksburg, Boston, Dallas

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING ⚡ 4

Two Combination Treatment Regimens of Nivolumab and Ipilimumab in Patients With dMMR and / or MSI mCRC.

This clinical trial is testing two combination treatment regimens of nivolumab and ipilimumab in patients with metastatic colorectal cancer (mCRC) who have deficient mismatch repair (dMMR) or microsatellite instability (MSI). The interventions involve administering nivolumab at two different dosages (480 mg and 240 mg) alongside ipilimumab, aiming to identify a regimen that demonstrates high clinical activity while minimizing toxicity. This is a Phase II trial that is currently active but not recruiting, indicating that it is ongoing and evaluating the safety and efficacy of the treatments for enrolled patients. Eligibility criteria include specific biomarkers such as MSI, MMR, dMMR, RAS, and microsatellite status.

NCT: NCT04730544 · Enrollment: 96 · Sites: Avignon, France, Besançon, France, Brest, France, Créteil, France, Dijon, France

MEDIUM PHASE1 All Stages HER2 TARGETED THERAPY • ACTIVE_NOT_RECRUITING ⚡ 4

CAR-macrophages for the Treatment of HER2 Overexpressing Solid Tumors

This clinical trial is testing the safety and tolerability of CAR-macrophages in patients with HER2 overexpressing solid tumors. The intervention involves the use of CT-0508 and Pembrolizumab, which are biological agents aimed at targeting and treating these specific tumors. Currently in Phase 1 and marked as active but not recruiting, this trial is focused on evaluating adverse events in the enrolled participants. Eligibility criteria include the requirement for tumors to overexpress the HER2 biomarker.

NCT: NCT04660929 · Enrollment: 48 · Sites: Chapel Hill, Duarte, Houston, Nashville, Philadelphia

MEDIUM PHASE1 Stage IV RAS TARGETED THERAPY • RECRUITING ⚡ 4

Study of CRX100 as Monotherapy and in Combination With Pembrolizumab in Patients With Advanced Solid Malignancies

This clinical trial is testing the safety and efficacy of CRX100, both as a monotherapy and in combination with Pembrolizumab, in patients with advanced solid malignancies, including colorectal cancer. The intervention involves administering CRX100 suspension for infusion alongside Fludarabine and Cyclophosphamide, which is significant for understanding potential treatment options for these cancers. Currently in Phase 1 and actively recruiting, this trial aims to assess treatment-emergent adverse events and dose-limiting toxicities, providing critical information for future treatment strategies. Eligible participants will be screened for specific biomarkers, including HER2 and RAS, to determine their suitability for the study.

NCT: NCT04282044 · Enrollment: 60 · Sites: La Jolla, Scottsdale, Stanford

MEDIUM NA All Stages MSI/MMR TARGETED THERAPY • RECRUITING ⚡ 4

Watch and Wait in PD-1 Monoclonal Antibody Treated dMMR/MSI-H Distal Rectal Cancer

This clinical trial is evaluating the "watch and wait" approach for patients with distal rectal cancer who have achieved a pathological complete response after treatment with PD-1 monoclonal antibodies. The intervention focuses on monitoring patients without immediate surgical intervention, which may reduce treatment-related complications and costs. Currently in the recruiting phase, this trial aims to assess the one-year disease-free survival rate, providing insights into the effectiveness of this approach for eligible patients. Participants must have biomarkers indicating dMMR/MSI-H status, among other criteria.

NCT: NCT04643041 · Enrollment: 47 · Sites: Guangzhou, China

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING ⚡ 4

PD-1 Inhibitors Combined With VEGF Inhibitors for Locally Advanced dMMR/MSI-H Colorectal Cancer

This clinical trial is testing the combination of PD-1 inhibitors and VEGF inhibitors in patients with locally advanced dMMR/MSI-H colorectal cancer. The intervention involves the use of Camrelizumab (a PD-1 inhibitor) and Apatinib (a VEGF inhibitor) to assess their effectiveness in achieving clinical or pathological complete response. This is a Phase II study that is currently active but not recruiting, meaning that while the trial is ongoing, no new participants are being enrolled at this time. Eligible patients must have locally advanced colorectal cancer with specific biomarkers, including dMMR, MSI-H, and RAS mutations.

NCT: NCT04715633 · Enrollment: 53 · Sites: Guangzhou, China

MEDIUM PHASE1, PHASE2 Stage IV IMMUNOTHERAPY • ACTIVE_NOT_RECRUITING ⚡ 4

Safety, PK and Efficacy of ONC-392 in Monotherapy and in Combination of Anti-PD-1 in Advanced Solid Tumors and NSCLC

This clinical trial is testing the safety, pharmacokinetics, and efficacy of ONC-392, a humanized anti-CTLA4 IgG1 monoclonal antibody, in patients with advanced or metastatic solid tumors and non-small cell lung cancer (NSCLC). The intervention involves administering ONC-392 both as a monotherapy and in combination with pembrolizumab and docetaxel, which is significant for understanding its potential effectiveness in these cancer types. Currently, the trial is in Phase 1 and Phase 2 and is active but not recruiting, indicating that patients cannot enroll at this time. Eligibility criteria may include specific biomarkers, although details on these requirements are not provided.

NCT: NCT04140526 · Enrollment: 733 · Sites: Ann Arbor, Atlanta, Atlantis, Aurora, Baltimore

MEDIUM PHASE2 All Stages HER2 TARGETED THERAPY • ACTIVE_NOT_RECRUITING ⚡ 4

Tucatinib Plus Trastuzumab and Oxaliplatin-based Chemotherapy or Pembrolizumab-containing Combinations for HER2+ Gastrointestinal Cancers

This clinical trial is testing the safety and efficacy of tucatinib in combination with trastuzumab and various chemotherapy regimens for patients with HER2-positive gastrointestinal cancers. The intervention involves tucatinib, a targeted therapy, alongside trastuzumab, oxaliplatin, leucovorin, and fluorouracil, to evaluate potential side effects and treatment effectiveness. Currently in Phase 2 and marked as active but not recruiting, this trial indicates that patients are not being enrolled at this time, but results may inform future treatment options. Eligibility criteria include having HER2-positive cancer affecting the gut, stomach, intestines, or gallbladder, as well as specific biomarker requirements related to HER2 and RAS.

NCT: NCT04430738 · Enrollment: 40 · Sites: Albuquerque, Aurora, City of Saint Peters, Cleveland, Creve Coeur

SIGNAL NA All Stages LIQUID BIOPSY • RECRUITING ⚡ 4

Circulating DNA to Improve Outcome of Oncology PatiEnt. A Randomized Study

This clinical trial is testing the effectiveness of a liquid biopsy approach in improving outcomes for patients with colorectal cancer. The intervention involves using genetic analysis of circulating tumor DNA (ctDNA) to guide treatment decisions and monitor patient response, which may enhance overall survival. Currently in the recruiting phase, this phase II trial aims to enroll 332 participants and will compare two treatment arms to assess the impact of ctDNA analysis versus standard imaging follow-up. Eligibility criteria include being diagnosed with colorectal cancer and meeting specific biomarker requirements for participation.

NCT: NCT04258137 · Enrollment: 332 · Sites: Bayonne, France, Bordeaux, France, Brest, France, Pau, France

MEDIUM PHASE1 Stage IV KRAS TARGETED THERAPY • ACTIVE_NOT_RECRUITING 4

A Study to Evaluate the Safety, Pharmacokinetics, and Activity of GDC-6036 Alone or in Combination in Participants With Advanced or Metastatic Solid Tumors With a KRAS G12C Mutation

This clinical trial is evaluating the safety, pharmacokinetics, and preliminary activity of GDC-6036, both alone and in combination with other therapies, in participants with advanced or metastatic solid tumors that have a KRAS G12C mutation. The intervention includes GDC-6036, along with Atezolizumab, Cetuximab, Bevacizumab, and Erlotinib, which are being tested to understand their effects on this specific mutation. Currently, the trial is in Phase I and is active but not recruiting, indicating that it is ongoing but not accepting new participants at this time. Eligibility for the trial requires the presence of a KRAS G12C mutation among other criteria.

NCT: NCT04449874 · Enrollment: 498 · Sites: Boston, Duarte, La Jolla, New Haven, Oklahoma City

MEDIUM PHASE2 Stage IV RAS PHASE II TRIAL • ACTIVE_NOT_RECRUITING 4

Radiochemotherapy +/- Durvalumab for Locally-advanced Anal Carcinoma. a Multicenter, Randomized, Phase II Trial of the German Anal Cancer Study Group

The RADIANCE trial is evaluating the efficacy of durvalumab, an immune checkpoint inhibitor, in combination with mitomycin C and 5-fluorouracil-based radiochemotherapy for patients with locally-advanced anal squamous cell carcinoma. This intervention aims to improve disease-free survival by enhancing the immune response during treatment. Currently in Phase II and marked as active but not recruiting, this trial indicates that patients are not being enrolled at this time, but results may inform future treatment options. Eligibility criteria include specific biomarkers such as RAS and NGS.

NCT: NCT04230759 · Enrollment: 180 · Sites: Berlin, Germany, Darmstadt, Germany, Dresden, Germany, Essen, Germany, Frankfurt, Germany

SIGNAL NA Stage III ctDNA LIQUID BIOPSY • ACTIVE_NOT_RECRUITING 4

ctDNA-guided Surveillance for Stage III CRC, a Randomized Intervention Trial

The IMPROVE-IT2 trial is testing ctDNA-guided surveillance for patients with Stage III colorectal cancer (CRC) to evaluate its effectiveness compared to standard CT-scan surveillance. The intervention involves ctDNA analysis as a diagnostic test, combined with an intensified follow-up schedule, to potentially enhance the early detection of recurrent disease and improve treatment eligibility. This trial is currently active but not recruiting participants, indicating that it is ongoing and results may be forthcoming for those interested in the outcomes. Eligibility criteria include the presence of ctDNA biomarkers, which are essential for participation in the study.

NCT: NCT04084249 · Enrollment: 359 · Sites: Aalborg, Denmark, Aarhus, Denmark, Copenhagen, Denmark, Herlev, Denmark, Herning, Denmark

MEDIUM NA All Stages TARGETED THERAPY • ACTIVE_NOT_RECRUITING 4

An Integrated Genomic Approach to Assess Genetic Risk and Drug Sensitivity

This clinical trial is assessing genetic risk and drug sensitivity in patients with colorectal cancer, among other cancers. The intervention involves creating a genomic profile to evaluate germline and somatic mutations using the Gersom panel, which is significant for understanding individual treatment responses. The trial is currently active but not recruiting new participants, indicating that it is in the data collection phase for the enrolled patients. Eligibility criteria include having colorectal cancer and may involve specific biomarker assessments, such as HER2.

NCT: NCT07555639 · Enrollment: 4000 · Sites: Roma, Italy

MEDIUM PHASE1 Stage IV RAS TARGETED THERAPY • ACTIVE_NOT_RECRUITING 4

Naptumomab Estafenatox in Combination With Durvalumab in Subjects With Selected Advanced or Metastatic Solid Tumor, Including a Cohort Expansion in Esophageal Cancer.

This clinical trial is testing the combination of naptumomab estafenatox and durvalumab in patients with selected advanced or metastatic solid tumors, including a cohort expansion specifically for esophageal cancer. The intervention involves administering these two agents together to evaluate their safety and tolerability, which is important for understanding potential treatment options for these patients. Currently, the trial is in Phase 1b and is active but not recruiting, meaning that while it is ongoing, no new participants are being enrolled at this time. Eligibility criteria include specific biomarkers such as HER2, RAS, and NGS, which may be relevant for patient selection.

NCT: NCT03983954 · Enrollment: 120 · Sites: Ahmedabad, India, Haifa, Israel, Hyderabad, India, Jhajjar, India, New Delhi, India

MEDIUM PHASE1 Stage IV MSI/MMR IMMUNOTHERAPY • RECRUITING 4

Testing an Immunotherapy Anti-cancer Drug, Nivolumab, for Advanced Cancers in Patients With Autoimmune Disorders, AIM-NIVO

This phase Ib clinical trial, AIM-NIVO, is testing the immunotherapy drug nivolumab in patients with advanced colorectal cancer who also have autoimmune disorders. The intervention includes nivolumab, ipilimumab, cabozantinib, and fluoropyrimidine, which are being evaluated for their effectiveness and side effects in treating metastatic or unresectable cancers. Currently, the trial is in the recruiting phase, meaning eligible patients can still enroll to participate in the study. Eligibility criteria include specific biomarkers such as MSI, RAS, and microsatellite status.

NCT: NCT03816345 · Enrollment: 300 · Sites: Atlanta, Baltimore, Bethesda, Birmingham, Boston

MEDIUM PHASE2 Stage IV PHASE II TRIAL • ACTIVE_NOT_RECRUITING 4

Microwave Ablation Versus Stereotactic Body Radiotherapy for Colorectal Liver Metastases in Oligometastatic Disease: a Prospective, Randomised, Phase 2 Trial

The LAVA-CRLM trial is testing the effectiveness of microwave ablation (MWA) compared to stereotactic body radiotherapy (SBRT) in patients with colorectal liver metastases and oligometastatic disease. The intervention involves using MWA, a device-based treatment, and SBRT, a form of radiation therapy, to assess their impact on local control and safety. This is a Phase 2 trial that is currently active but not recruiting, indicating that while the study is ongoing, no new participants are being enrolled at this time. Eligibility criteria may include specific characteristics related to the patient's metastatic disease status, although no specific biomarkers are mentioned.

NCT: NCT03654131 · Enrollment: 100 · Sites: Copenhagen, Denmark

MEDIUM PHASE2 All Stages RAS IMMUNOTHERAPY • ACTIVE_NOT_RECRUITING 4

Nivolumab and Ipilimumab in Treating Patients With Rare Tumors

This phase II clinical trial is investigating the efficacy of nivolumab and ipilimumab in treating patients with rare tumors. The intervention involves the use of these monoclonal antibodies, which may enhance the immune system's ability to combat cancer and inhibit tumor growth and spread. Currently, the trial is active but not recruiting new participants, indicating that it is ongoing with enrolled patients being monitored for outcomes. Eligibility criteria include specific types of epithelial tumors, such as squamous cell carcinoma and adenocarcinoma of the nasal cavity and salivary glands, among others.

NCT: NCT02834013 · Enrollment: 798 · Sites: Aberdeen, Adrian, Aitkin, Albuquerque, Allentown

MEDIUM PHASE2 All Stages NTRK TARGETED THERAPY • ACTIVE_NOT_RECRUITING 4

Basket Study of Entrectinib (RXDX-101) for the Treatment of Patients With Solid Tumors Harboring NTRK 1/2/3 (Trk A/B/C), ROS1, or ALK Gene Rearrangements (Fusions)

This clinical trial is testing the efficacy of entrectinib (RXDX-101) in patients with solid tumors that have NTRK1/2/3, ROS1, or ALK gene rearrangements. The intervention, entrectinib, is a targeted therapy that aims to address specific genetic alterations in tumors, which may influence treatment outcomes. Currently in Phase 2 and marked as active but not recruiting, this trial indicates that patients may not be able to enroll at this time, but results could inform future treatment options. Eligibility criteria include the presence of specific biomarkers, such as NTRK gene fusions.

NCT: NCT02568267 · Enrollment: 534 · Sites: Ann Arbor, Athens, Atlanta, Aurora, Baltimore

MEDIUM PHASE2 Stage IV RAS IMMUNOTHERAPY • ACTIVE_NOT_RECRUITING 4

Nivolumab With or Without Ipilimumab in Treating Patients With Refractory Metastatic Anal Canal Cancer

This phase II clinical trial is investigating the effectiveness of nivolumab, with or without ipilimumab, in patients with refractory metastatic anal canal cancer. The intervention involves the use of these monoclonal antibodies, which may enhance the immune system's ability to target and eliminate cancer cells. Currently, the trial is active but not recruiting new participants, indicating that it is ongoing with the existing enrolled population of 143 patients. Eligibility criteria include the presence of specific biomarkers, such as RAS, which may be relevant for patient selection.

NCT: NCT02314169 · Enrollment: 143 · Sites: Ann Arbor, Aurora, Bellevue, Buffalo, Chicago

SIGNAL NA All Stages RESEARCH ● RECRUITING 4

Association Between Health Care Provider (HCP)-Assessed ECOG Performance Status (PS) and Overall Survival, and Objectively Measure of Physical Activity (PA) Levels in Advance-cancer Patients"

This clinical trial is testing the association between health care provider-assessed ECOG performance status and objectively measured physical activity levels in patients with advanced cancer. The intervention includes a behavioral exercise program and multiple health telemonitoring components, which aim to enhance the understanding of how physical activity impacts performance status and overall survival. Currently in the recruiting phase, this study involves 590 participants and seeks to complete its final assessments to evaluate its primary outcome. Eligibility criteria have not been specified in the provided information.

NCT: NCT01365169 · Enrollment: 590 · Sites: Houston

Appendix A — Patient Guide to Active Trials

For patients, caregivers, and family members. Always discuss with your oncologist before considering a clinical trial.

What is a clinical trial?

Clinical trials test new treatments, combinations, or approaches to care. Participating can give you access to treatments not yet widely available. Trials are listed by the biomarker your tumor must have — because many newer treatments only work for specific mutations. Ask your oncologist which biomarkers your tumor has been tested for, then look for matching trials below.

MSI/MMR

Efficacy of the Use of Neoadjuvant With/Without Hyperthermic Intraperitoneal Chemotherapy in the Treatment of Locally Advanced Colon Cancer

Phase: PHASE3 · Status: RECRUITING · NCT06783491

This clinical trial is testing the efficacy of neoadjuvant treatment strategies, with or without hyperthermic intraperitoneal chemotherapy (HIPEC), in patients with locally advanced colon cancer. The intervention involves administering FOLFOX chemotherapy followed by cytoreductive surgery and may include mitomycin C as part of the HIPEC procedure, aiming to improve disease-free survival rates. This is a Phase 3 trial currently recruiting participants, which means eligible patients may have the opportunity to receive a potentially more effective treatment approach compared to standard care. Eligibility criteria include patients with locally advanced colon adenocarcinoma (cT4, cT3 with invasion >5mm) Nx and no metastases, with specific biomarker assessments for MMR, DMMR, and microsatellite status.

BRAF

JSKN003 Versus Physician Choiced Treatment in Patients With HER2-positive and Advanced Colorectal Cancer Who Had Failed to Respond to Oxaliplatin, 5-Fu, and Irinotecan

Phase: PHASE3 · Status: NOT_YET_RECRUITING · NCT07384377

This clinical trial is testing the efficacy and safety of the drug JSKN003 compared to physician-chosen treatments in patients with HER2-positive and advanced colorectal cancer who have not responded to previous therapies, including oxaliplatin, 5-FU, and irinotecan. The intervention involves administering JSKN003 alongside options like TAS-102, regorafenib, and fruquintinib, which are significant as they represent standard treatment choices for this patient population. This is a Phase 3 trial that is currently not yet recruiting, meaning patients will need to wait for enrollment to begin before participating. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, MMR, DMMR, HER2, and RAS.

KRAS

A Study of Amivantamab and FOLFIRI Versus Cetuximab/Bevacizumab and FOLFIRI in Participants With KRAS/NRAS and BRAF Wild-type Colorectal Cancer Who Have Previously Received Chemotherapy

Phase: PHASE3 · Status: RECRUITING · NCT06750094

This clinical trial is testing the efficacy of amivantamab combined with FOLFIRI chemotherapy compared to cetuximab or bevacizumab with FOLFIRI in patients with KRAS/NRAS and BRAF wild-type colorectal cancer who have previously undergone chemotherapy. The intervention involves the biological agents amivantamab, cetuximab, and bevacizumab, along with the chemotherapy drugs 5-fluorouracil and leucovorin, which are important for evaluating progression-free survival and overall survival in this patient population. This is a Phase 3 trial currently recruiting 700 participants, which indicates that it is in the later stages of testing and aims to provide more definitive evidence regarding treatment effectiveness. Eligibility criteria include specific biomarker requirements related to KRAS, NRAS, and BRAF status, among others.

ctDNA

ctDNA-guided Selection of Adjuvant Chemotherapy Regimens for Elderly Colon Cancer Patients After Surgery: A Single-center, Randomized, Controlled Study

Phase: PHASE3 · Status: RECRUITING · NCT06609551

This clinical trial is testing the effectiveness of ctDNA-guided selection of adjuvant chemotherapy regimens in elderly patients with high-risk stage II and stage III colon cancer following surgery. Participants will receive either 6 months of 5-FU monotherapy or an intensive XELOX treatment regimen, which is significant for tailoring chemotherapy based on ctDNA detection. Currently in Phase 3 and actively recruiting, this trial aims to provide insights into disease-free survival outcomes for eligible patients. Eligibility criteria include being an elderly patient with high-risk stage II or stage III colon cancer and undergoing ctDNA testing post-surgery.

NGS

A Phase III Trial to Evaluate the Efficacy, Immunogenicity and Safety of a Recombinant Human Papillomavirus 9-Valent (Types 6, 11, 16, 18, 31, 33, 45, 52, 58) Vaccine (E.Coli) in Chinese Males

Phase: PHASE3 · Status: ACTIVE_NOT_RECRUITING · NCT06866574

This Phase III clinical trial is evaluating the efficacy, immunogenicity, and safety of a Recombinant Human Papillomavirus 9-Valent Vaccine in Chinese males aged 18-45 years. The intervention involves a vaccine targeting multiple HPV types, which is significant for preventing associated genital warts and cancers. Currently, the trial is active but not recruiting, indicating that while the study is ongoing, no new participants are being enrolled at this time. Eligibility criteria include being a male aged 18-45 years, and the study utilizes next-generation sequencing (NGS) for biomarker analysis.

HER2

A Study of Tucatinib With Trastuzumab and mFOLFOX6 Versus Standard of Care Treatment in First-line HER2+ Metastatic Colorectal Cancer

Phase: PHASE3 · Status: RECRUITING · NCT05253651

This clinical trial is testing the efficacy of tucatinib in combination with trastuzumab and mFOLFOX6 compared to standard of care treatments for patients with HER2 positive metastatic colorectal cancer. The intervention involves the use of tucatinib, a targeted therapy, alongside other established cancer drugs, to evaluate its effectiveness and side effects in this patient population. Currently in Phase 3 and actively recruiting, this trial aims to provide insights into progression-free survival outcomes for participants. Eligibility criteria include having HER2 positive colorectal cancer that is metastatic or unresectable, with specific biomarker assessments for HER2 and RAS.

RAS

EA2176: Phase 3 Clinical Trial of Carboplatin and Paclitaxel +/- Nivolumab in Metastatic Anal Cancer Patients

Phase: PHASE3 · Status: ACTIVE_NOT_RECRUITING · NCT04444921

The EA2176 clinical trial is testing the effectiveness of adding nivolumab to a chemotherapy regimen of carboplatin and paclitaxel in patients with metastatic anal cancer. The intervention involves the use of nivolumab, an immunotherapy drug, alongside standard chemotherapy, which may enhance the immune system's ability to combat cancer and potentially improve treatment outcomes. This is a Phase 3 trial that is currently active but not recruiting, indicating that it is in the final stages of testing before potential approval, and patients are not currently being enrolled. Eligibility for participation includes specific biomarker requirements related to RAS.

NTRK

Basket Study of Entrectinib (RXDX-101) for the Treatment of Patients With Solid Tumors Harboring NTRK 1/2/3 (Trk A/B/C), ROS1, or ALK Gene Rearrangements (Fusions)

Phase: PHASE2 · Status: ACTIVE_NOT_RECRUITING · NCT02568267

This clinical trial is testing the efficacy of entrectinib (RXDX-101) in patients with solid tumors that have NTRK1/2/3, ROS1, or ALK gene rearrangements. The intervention, entrectinib, is a targeted therapy that aims to address specific genetic alterations in tumors, which may influence treatment outcomes. Currently in Phase 2 and marked as active but not recruiting, this trial indicates that patients may not be able to enroll at this time, but results could inform future treatment options. Eligibility criteria include the presence of specific biomarkers, such as NTRK gene fusions.

What this means for you

Ask your oncologist whether any active trials match your biomarker profile and disease stage. The most actively trialed biomarkers in colorectal cancer right now are **MSI/MMR, BRAF, KRAS, ctDNA, and NGS**. If your tumor has not been tested for these markers, ask your oncologist before your next treatment decision — biomarker results can determine which trials you qualify for.

Questions to ask your oncologist about trials

"Am I eligible for any active Phase III trials based on my biomarker profile?"
"Does my tumor need to be retested before I can qualify for a biomarker-directed trial?"
"What are the travel requirements and visit frequency for the trials I might qualify for?"

Source: ClinicalTrials.gov · 2026-08-03 07:30:00
This is not medical advice. Always speak with your oncologist before making any treatment decisions.

Appendix B — Clinical Trial Reference Guide

What the phases mean

Phase I — First testing in humans. Focus on safety and dosing. Small groups.

Phase II — Testing effectiveness. Larger groups. Determines if Phase III is warranted.

Phase III — Randomized comparison against standard treatment. Required for FDA approval.

Key biomarkers that determine trial eligibility

RAS (KRAS/NRAS) — mutation status affects anti-EGFR eligibility and KRAS G12C trial eligibility

BRAF V600E — required for encorafenib-based trials (~8–10% of CRC)

MSI-H/dMMR — required for immunotherapy trials; ~5% of mCRC, ~15% of Stage II/III

HER2 — required for HER2-directed trials (~2–3% of CRC)

NTRK fusion — required for TRK inhibitor trials (<1% of CRC)

KRAS G12C — required for sotorasib/adagrasib trials (~3–4% of CRC)

TMB-H — tumor mutational burden; may qualify for immunotherapy

ctDNA — liquid biopsy; used in MRD monitoring trials

How to find trials you may qualify for

1. Get complete biomarker testing: RAS, BRAF, MSI/MMR, HER2, NTRK, TMB
2. Search ClinicalTrials.gov with your biomarker and stage
3. Ask your oncologist about NCI-designated cancer centers with trial access
4. Contact the Colorectal Cancer Alliance: ccalliance.org
