Colon & Colorectal Cancer — Clinical Trials Intelligence

Alert Window: Last 30 Days · Generated: 2026-06-08 07:30:00

Situation Summary

Phase Iii: 132 trials
Recruiting: 723 trials
Biomarker: 600 biomarker-directed trials
Breakthrough: 295 trials scored ≥ 4

Active Trial Timeline

Showing 295 high-significance trials (score ≥ 4). 911 additional lower-scored trials are collapsed below. Phase III trials appear first. Click any title to view full trial details on ClinicalTrials.gov.

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY ● RECRUITING 11

A Clinical Trial Comparing Long-Course Versus Short-Course Radiotherapy Followed by Immunotherapy Combined With Total Neoadjuvant Therapy (TNT) to Long-Course Radiotherapy Followed by TNT in Locally Advanced Rectal Cancer

This clinical trial is testing the efficacy of short-course versus long-course radiotherapy followed by immunotherapy combined with total neoadjuvant therapy (TNT) in patients with locally advanced rectal cancer. The interventions include short-course and long-course radiotherapy, along with the drugs capecitabine, oxaliplatin, and HLX10, which are important for evaluating different treatment approaches. Currently in Phase 3 and actively recruiting, this trial aims to enroll 444 participants, which may provide insights into treatment options for patients. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and RAS.

NCT: NCT07113275 · Enrollment: 444 · Sites: Wuhan, China

MEDIUM PHASE3 Stage III MSI/MMR TARGETED THERAPY ● RECRUITING 11

Neoadjuvant/Adjuvant AK104 in Microsatellite Instability-high or Mismatch Repair-deficient, Resectable Colon Cancer

This clinical trial is testing the efficacy and safety of neoadjuvant/adjuvant treatment with AK104 (Cadonilimab) in patients with resectable microsatellite instability-high (MSI-H) or mismatch repair-deficient (dMMR) colon cancer. The intervention involves AK104 in combination with standard chemotherapy agents, including Oxaliplatin, Capecitabine, 5-Fluorouracil, and Calcium Folinate, which is significant for potentially improving treatment outcomes in this specific patient population. This is a Phase 3 study currently recruiting 386 participants, indicating that patients may have the opportunity to access this investigational treatment while contributing to important research. Eligibility criteria include having resectable MSI-H or dMMR colon cancer, with specific biomarker requirements related to microsatellite instability and mismatch repair status.

NCT: NCT07412613 · Enrollment: 386 · Sites: Guangzhou, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY ● RECRUITING 11

Botensilimab + Balstilimab vs Best Supportive Care as Therapy in Chemo-refractory, Unresectable, Colorectal Adenocarcinoma

This clinical trial is testing the combination of botensilimab and balstilimab in patients with chemo-refractory, unresectable colorectal adenocarcinoma. The intervention involves two immunotherapy drugs aimed at potentially improving overall survival and quality of life for participants. Currently in Phase 3 and actively recruiting, this trial may provide insights into the effectiveness and safety of these treatments for eligible patients. Participants may need to meet specific biomarker criteria, including MSI, MSI-H, MMR, DMMR, and microsatellite status.

NCT: NCT07152821 · Enrollment: 834 · Sites: Greenfield Park, Canada, Kingston, Canada, Oshawa, Canada, Ottawa, Canada, Prince George, Canada

MEDIUM PHASE3 Stage IV BRAF TARGETED THERAPY • NOT_YET_RECRUITING 11

JSKN003 Versus Physician Choiced Treatment in Patients With HER2-positive and Advanced Colorectal Cancer Who Had Failed to Respond to Oxaliplatin, 5-Fu, and Irinotecan

This clinical trial is testing the efficacy and safety of JSKN003 compared to physician-chosen treatments in patients with HER2-positive and advanced colorectal cancer who have not responded to previous therapies, including oxaliplatin, 5-FU, and irinotecan. The intervention, JSKN003, is being evaluated to determine its effectiveness in improving patient outcomes, specifically progression-free survival (PFS). This is a Phase 3 trial that is not yet recruiting, meaning patients will need to wait for enrollment to begin before they can participate. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, MMR, DMMR, HER2, and RAS.

NCT: NCT07384377 · Enrollment: 123 ·

MEDIUM PHASE3 Stage IV BRAF TARGETED THERAPY • RECRUITING 11

Symbiotic-GI-03: A Study to Learn About the Study Medicine Called PF-08634404 in Combination With Chemotherapy in Adult Participants With Metastatic Colorectal Cancer

The Symbiotic-GI-03 trial is investigating the efficacy of PF-08634404 in combination with chemotherapy in adult participants with metastatic colorectal cancer. This study aims to determine how well PF-08634404 works alongside standard chemotherapy treatments, which is significant for patients whose cancer has spread or recurred after previous therapies. Currently in Phase 3 and actively recruiting, this trial offers eligible patients the opportunity to receive either the investigational drug or an approved treatment regimen. To qualify, participants must be 18 years or older, have metastatic colorectal cancer, and meet specific health criteria, including not being pregnant prior to treatment.

NCT: NCT07222800 · Enrollment: 800 · Sites: Aberdeen, Abilene, Albany, Amarillo, Arlington

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • NOT_YET_RECRUITING 11

Irinotecan Liposomes in Total Neoadjuvant Therapy in Locally Advanced Rectal Cancer

This clinical trial is testing the efficacy and safety of irinotecan liposomes in combination with standard total neoadjuvant therapy for patients with locally advanced rectal cancer. The intervention involves the use of NALIRI (irinotecan liposomes), along with LCRT (radiation) and FOLFOX (chemotherapy), to evaluate its impact on treatment outcomes. This is a Phase 3 trial that is not yet recruiting, meaning patients will need to wait for enrollment to begin before participating. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, microsatellite status, and mismatch repair status.

NCT: NCT07074353 · Enrollment: 360 · Sites: Hangzhou, China

MEDIUM PHASE2, PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

Node-Sparing Short-Course Radiotherapy Plus Chemotherapy, Bevacizumab and PD-1 Inhibitor in Metastatic pMMR/MSS Colorectal Cancer (MODIFI-CRC)

This clinical trial, known as MODIFI-CRC, is testing the effectiveness of node-sparing short-course radiotherapy combined with chemotherapy, bevacizumab, and a PD-1 inhibitor in patients with metastatic pMMR/MSS colorectal cancer. The intervention aims to enhance tumor response by utilizing radiotherapy to improve the efficacy of immunotherapy and targeted treatments, addressing the limitations of current standard therapies. Currently in Phase 2/3 and actively recruiting participants, this trial may offer patients an opportunity to receive a potentially more effective treatment regimen. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and NGS.

NCT: NCT06958419 · Enrollment: 286 · Sites: Guangzhou, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

PRODIGE 90

The PRODIGE 90 trial is investigating the combination of neoadjuvant Dostarlimab and short course radiotherapy for patients with microsatellite unstable or mismatch repair-deficient locally advanced rectal cancer. The intervention involves administering Dostarlimab, an anti-PD1 immunotherapy, alongside radiotherapy, which may offer a nonoperative management strategy for patients who achieve no detectable residual cancer after treatment. This is a Phase 3 trial currently recruiting participants, which means eligible patients may have the opportunity to access this investigational approach while contributing to the understanding of its effectiveness. Eligibility criteria include specific biomarkers such as MSI, MMR, and RAS status, which are important for determining patient suitability for the trial.

NCT: NCT06762405 · Enrollment: 68 · Sites: Dijon, France

MEDIUM PHASE3 All Stages KRAS TARGETED THERAPY • RECRUITING 11

A Study of Amivantamab and FOLFIRI Versus Cetuximab/Bevacizumab and FOLFIRI in Participants With KRAS/NRAS and BRAF Wild-type Colorectal Cancer Who Have Previously Received Chemotherapy

This clinical trial is testing the efficacy of amivantamab combined with FOLFIRI chemotherapy compared to cetuximab or bevacizumab with FOLFIRI in patients with KRAS/NRAS and BRAF wild-type colorectal cancer who have previously undergone chemotherapy. The intervention involves the biological agents amivantamab, cetuximab, and bevacizumab, along with the chemotherapy drugs 5-fluorouracil and leucovorin, which are important for evaluating progression-free survival and overall survival in this patient population. This is a Phase 3 trial currently recruiting 700 participants, which indicates that it is in the later stages of testing and aims to provide more definitive evidence regarding treatment effectiveness. Eligibility criteria include specific biomarker requirements related to KRAS, NRAS, and BRAF status, among others.

NCT: NCT06750094 · Enrollment: 700 · Sites: Abilene, Ann Arbor, Arlington, Athens, Atlanta

MEDIUM PHASE3 Stage III MSI/MMR TARGETED THERAPY • RECRUITING 11

A Study of Neoadjuvant QL1706 in Participants With Untreated dMMR/MSI-H Resectable Colon Cancer

This clinical trial is testing the efficacy of neoadjuvant QL1706 in participants with untreated, resectable colon cancer characterized by microsatellite instability high (MSI-H) or defective mismatch repair (dMMR). The intervention involves administering QL1706 alongside CAPEOX/Capecitabine to assess its impact on tumor response prior to surgery. This is a Phase 3 trial currently recruiting 363 participants, which indicates that it is in the later stages of testing and may provide critical data on treatment effectiveness for patients. Eligibility criteria include having untreated T4N0 or Stage III colon cancer with specific biomarker characteristics (MSI-H/dMMR).

NCT: NCT06686576 · Enrollment: 363 · Sites: Guangzhou, China

MEDIUM PHASE3 Stage III MSI/MMR TARGETED THERAPY • RECRUITING 11

Adjuvant PD-1 Blockade for High-risk Stage-II DMMR/MSI-H Colorectal Cancer

This phase III clinical trial is investigating the efficacy of Tislelizumab, a PD-1 blockade drug, as adjuvant therapy for patients with high-risk stage II dMMR/MSI-H colorectal cancer. The trial aims to compare the outcomes of this intervention with standard of care, focusing on disease-free survival (DFS) as the primary outcome. Currently, the trial is recruiting 180 participants, which means eligible patients may have the opportunity to receive this treatment while contributing to important research. Eligibility criteria include the presence of specific biomarkers such as MSI, MSI-H, MMR, and DMMR.

NCT: NCT06520683 · Enrollment: 180 · Sites: Guangzhou, China

MEDIUM PHASE3 Stage IV KRAS TARGETED THERAPY • RECRUITING 11

A Study of Amivantamab and mFOLFOX6 or FOLFIRI Versus Cetuximab and mFOLFOX6 or FOLFIRI as First-line Treatment in Participants With KRAS/NRAS and BRAF Wild-type Unresectable or Metastatic Left-sided Colorectal Cancer

This clinical trial is testing the effectiveness of amivantamab combined with standard chemotherapy regimens (mFOLFOX6 or FOLFIRI) compared to cetuximab with the same chemotherapy in adults with KRAS, NRAS, and BRAF wild-type unresectable or metastatic left-sided colorectal cancer. The intervention involves the biological agents amivantamab and cetuximab, along with chemotherapy drugs, to evaluate their impact on progression-free survival (PFS). This is a Phase 3 trial currently recruiting 1,000 participants, which means eligible patients may have the opportunity to receive either treatment while contributing to important research outcomes. Eligibility criteria include specific biomarker requirements related to KRAS, NRAS, BRAF, and other markers such as MSI and MMR status.

NCT: NCT06662786 · Enrollment: 1000 · Sites: Abilene, Albuquerque, Ann Arbor, Arlington, Atlanta

SIGNAL PHASE3 Stage III ctDNA LIQUID BIOPSY • RECRUITING 11

ctDNA-guided Selection of Adjuvant Chemotherapy Regimens for Elderly Colon Cancer Patients After Surgery: A Single-center, Randomized, Controlled Study

This clinical trial is testing the effectiveness of ctDNA-guided selection of adjuvant chemotherapy regimens in elderly patients with high-risk stage II and stage III colon cancer following surgery. Participants will receive either 6 months of 5-FU monotherapy or an intensive XELOX treatment regimen, which is significant for tailoring chemotherapy based on ctDNA detection. Currently in Phase 3 and actively recruiting, this trial aims to provide insights into disease-free survival outcomes for eligible patients. Eligibility criteria include being an elderly patient with high-risk stage II or stage III colon cancer and undergoing ctDNA testing post-surgery.

NCT: NCT06609551 · Enrollment: 312 · Sites: Hangzhou, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

Personalising and Refining Neo-adjuvant Chemotherapy in Locally Advanced but Resecable Colon Cancer in the Elderly of 70 Years Old or More

This clinical trial is testing the effectiveness of personalized neo-adjuvant chemotherapy in elderly patients aged 70 years or older with locally advanced but resectable colon cancer. The intervention involves administering the Folfox regimen prior to surgery, which is significant as it aims to improve outcomes for a population that often does not receive adjuvant chemotherapy due to frailty. This is a Phase 3 trial currently recruiting 150 participants, which means eligible patients may have the opportunity to receive this treatment while contributing to important research. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, and DMMR.

NCT: NCT06293625 · Enrollment: 150 · Sites: Dijon, France

MEDIUM PHASE2, PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

Sacituzumab Govitecan in Metastatic Colorectal Cancer

This clinical trial is testing the efficacy of Sacituzumab Govitecan (SG) in patients with metastatic colorectal cancer who have become refractory to at least two lines of standard chemotherapy and are not candidates for local therapy. The intervention involves administering SG compared to the physician's choice of treatment, which is significant as it may provide an alternative option for patients with limited treatment choices. This is a Phase II/III trial currently recruiting participants, indicating that patients may have the opportunity to access this investigational treatment while contributing to the research. Eligibility criteria include documented progression or intolerability to specific chemotherapy regimens and a minimum 6-month interval since the last use of Irinotecan.

NCT: NCT06243393 · Enrollment: 80 · Sites: Heidelberg, Germany

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING 11

Injection of SHR-A1811 Versus Physician Choiced Treatment in Patients With Advanced Colorectal Cancer Who Had Failed to Respond to Oxaliplatin, 5-fu, and Irinotecan

This clinical trial is testing the efficacy and safety of SHR-A1811 in patients with advanced colorectal cancer who have not responded to previous treatments with oxaliplatin, 5-FU, and irinotecan. The intervention involves the drug SHR-A1811, which is being compared to physician-chosen treatments such as TAS-102, regorafenib, and fruquintinib. This is a Phase 3 trial that is currently active but not recruiting, meaning that while the study is ongoing, no new participants are being enrolled at this time. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and RAS.

NCT: NCT06199973 · Enrollment: 130 · Sites: Shanghai, China

MEDIUM PHASE3 Stage III MSI/MMR TARGETED THERAPY • RECRUITING 11

Study of Perioperative Dostarlimab in Participants With Untreated T4N0 or Stage III dMMR/MSI-H Resectable Colon Cancer

This clinical trial is testing the efficacy of perioperative dostarlimab in participants with untreated T4N0 or Stage III dMMR/MSI-H resectable colon cancer. The intervention involves dostarlimab, a biological therapy, in combination with standard chemotherapy regimens CAPEOX and FOLFOX, which is significant for its potential to improve event-free survival compared to standard care. This is a Phase 3 trial currently recruiting 892 participants, indicating that patients may have the opportunity to access this treatment while contributing to important research. Eligibility criteria include the presence of specific biomarkers such as MSI, MSI-H, MMR, and DMMR.

NCT: NCT05855200 · Enrollment: 892 · Sites: Akron, Ann Arbor, Appleton, Baton Rouge, Bethesda

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

Preoperative Short-course Radiation Followed by Envafolimab Plus CAPEOX for MSS Locally Advanced Rectal Adenocarcinoma

This clinical trial is testing the combination of preoperative short-course radiation followed by Envafolimab and CAPEOX chemotherapy in patients with microsatellite stable (MSS) locally advanced rectal adenocarcinoma. The intervention involves the use of Envafolimab, a PD-L1 monoclonal antibody, which may enhance the effectiveness of short-course radiotherapy and chemotherapy. This is a Phase 3 trial currently recruiting participants, which means eligible patients may have the opportunity to receive this investigational treatment while contributing to important research. Eligibility criteria include specific biomarker requirements such as MSI, MSI-H, MMR, DMMR, and RAS status.

NCT: NCT05752136 · Enrollment: 108 · Sites: Hangzhou, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

Total Neoadjuvant Treatment ±Immunotherapy for High Risk Locally Advanced Rectal Cancer (TNTi)

The TNTi clinical trial is testing the effectiveness of total neoadjuvant treatment with and without the immunotherapy drug camrelizumab for patients with high-risk locally advanced rectal cancer. This intervention is significant as it aims to determine the pathologic complete response (PCR) rate, which is a critical measure of treatment effectiveness. Currently in Phase 3 and actively recruiting 472 participants, this trial may provide insights into treatment options for patients facing this diagnosis. Eligibility criteria include specific biomarkers such as MSI, MMR, DMMR, RAS, and microsatellite instability.

NCT: NCT06229041 · Enrollment: 472 · Sites: Beijing, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING 11

A Study of HX008 Compared to Chemotherapy in the First-Line Treatment of Subjects With MSI-H/dMMR Metastatic Colorectal Cancer

This clinical trial is testing the efficacy of HX008 (Pucotenlimab) compared to Investigator's Choice Chemotherapy in patients with metastatic colorectal cancer characterized by Microsatellite Instability High (MSI-H) or Mismatch Repair Deficient (dMMR). The intervention involves administering HX008, which is being evaluated for its potential clinical benefits in improving progression-free survival (PFS) compared to standard chemotherapy options. This is a Phase 3 trial that is currently active but not recruiting, indicating that it is in the final stages of testing before potential approval, and patients are not being enrolled at this time. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, dMMR, and RAS status.

NCT: NCT05652894 · Enrollment: 190 · Sites: Beijing, China, Bengbu, China, Changchun, China, Changde, China, Changsha, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING 11

Study of XL092 + Atezolizumab vs Regorafenib in Participants With Metastatic Colorectal Cancer

This clinical trial is testing the combination of XL092 and atezolizumab against regorafenib in participants with metastatic colorectal cancer who have progressed during, after, or are intolerant to standard-of-care therapy. The intervention involves the use of XL092 and atezolizumab, which may provide a different therapeutic approach compared to regorafenib. This is a Phase 3 trial that is currently active but not recruiting, indicating that it is in the final stages of testing and may soon provide important data on treatment efficacy. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, RAS, and microsatellite status.

NCT: NCT05425940 · Enrollment: 901 · Sites: Albuquerque, Billings, Charlotte, Chattanooga, Cincinnati

MEDIUM PHASE3 Stage III MSI/MMR TARGETED THERAPY • RECRUITING 11

PACE: PD-1 Antibody For dMMR/MSI-H Stage III Colorectal Cancer

The PACE trial is investigating the efficacy of the PD-1 antibody Sintilimab in patients with dMMR/MSI-H Stage III colorectal cancer. Participants will receive either Sintilimab alone or a combination of oxaliplatin and capecitabine, which are standard chemotherapy agents, to assess their impact on disease-free survival. This is a Phase 3 study currently recruiting 323 participants, indicating that patients may have the opportunity to access this treatment while contributing to important clinical research. Eligibility criteria include having local advanced colon cancer with specific biomarkers such as dMMR or MSI-H.

NCT: NCT05236972 · Enrollment: 323 · Sites: Guangzhou, China

MEDIUM PHASE3 Stage IV BRAF TARGETED THERAPY • ACTIVE_NOT_RECRUITING 11

A Study of Anlotinib Hydrochloride Capsule Combined With Chemotherapy as First-line Treatment in Subjects With RAS/BRAF Wild Metastatic Colorectal Cancer

This clinical trial is testing the combination of Anlotinib hydrochloride capsules with chemotherapy as a first-line treatment for patients with RAS/BRAF wild-type unresectable metastatic colorectal cancer. The intervention involves administering Anlotinib alongside standard chemotherapy agents Bevacizumab, Oxaliplatin, and Capecitabine, which is significant for evaluating potential improvements in treatment outcomes. Currently, the trial is in Phase 3 and is active but not recruiting, indicating that it is in the final stages of testing before potential approval. Eligibility criteria include specific biomarker requirements related to BRAF, MSI, MMR, and RAS status.

NCT: NCT04854668 · Enrollment: 748 · Sites: Beijing, China, Changchun, China, Changsha, China, Changzhi, China, Changzhou, China

MEDIUM PHASE2, PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

A Clinical Study to Evaluate Efficacy and Safety of Serplulimab （HLX10） Combined With Bevacizumab （HLX04) and Chemotherapy (XELOX) in Patients With Metastatic Colorectal Cancer (mCRC)

This clinical trial is evaluating the efficacy and safety of Serplulimab (HLX10) combined with Bevacizumab (HLX04) and chemotherapy (XELOX) in patients with metastatic colorectal cancer (mCRC). The intervention involves the use of HLX10, a drug that is being tested against a placebo to determine its effectiveness in improving patient outcomes. Currently, the trial is in Phase 2 and Phase 3 and is actively recruiting participants, which means eligible patients may have the opportunity to receive this treatment as part of the study. Eligibility criteria include the presence of specific biomarkers, such as MSI or MSI-H.

NCT: NCT04547166 · Enrollment: 568 · Sites: Guangzhou, China, Hangzhou, China, Kashiwa, Japan, Linyi, China, Shanghai, China

MEDIUM PHASE3 Stage IV BRAF TARGETED THERAPY • ACTIVE_NOT_RECRUITING 11

A Study of Encorafenib Plus Cetuximab With or Without Chemotherapy in People With Previously Untreated Metastatic Colorectal Cancer

This clinical trial is evaluating the effectiveness of encorafenib plus cetuximab, with or without standard chemotherapy, in patients with previously untreated metastatic colorectal cancer that has a BRAF mutation. The intervention involves administering encorafenib orally and cetuximab via intravenous infusion, either alone or in combination with chemotherapy agents such as oxaliplatin and irinotecan. This is a Phase 3 trial that is currently active but not recruiting, indicating that it is in the final stages of testing before potential approval, and patients may not be able to enroll at this time. Eligibility criteria include having a BRAF mutation and being treatment-naive for metastatic colorectal cancer.

NCT: NCT04607421 · Enrollment: 831 · Sites: Aventura, Basking Ridge, Berkeley Heights, Chicago, City of Saint Peters

MEDIUM PHASE3 Stage III MSI/MMR LIQUID BIOPSY • RECRUITING 11

Circulating Tumour DNA Based Decision for Adjuvant Treatment in Colon Cancer Stage II Evaluation

The CIRCULATE study is evaluating adjuvant therapy for patients with UICC stage II colon cancer. The intervention involves the use of capecitabine to assess its impact on disease-free survival in patients who test positive for postoperative circulating tumor DNA. This is a Phase 3 trial that is currently recruiting participants, which means eligible patients may have the opportunity to receive capecitabine as part of their treatment. Eligibility criteria include specific biomarker assessments such as MSI, MMR, and RAS status.

NCT: NCT04089631 · Enrollment: 4812 · Sites: Dresden, Germany

MEDIUM PHASE3 Stage IV BRAF LIQUID BIOPSY • RECRUITING 11

Identification and Treatment Of Micrometastatic Disease in Stage III Colon Cancer

This clinical trial is testing various treatment options for patients with Stage III colon cancer who have micrometastatic disease. The interventions include the FOLFIRI protocol, Nivolumab, Encorafenib/Binimetinib/Cetuximab, Trastuzumab + Pertuzumab, and active surveillance, which are important for determining the most effective approach based on individual blood test results. Currently in Phase 3 and actively recruiting, this trial aims to assess disease-free survival (DFS) among participants, which is a critical measure of treatment effectiveness. Eligibility may involve specific biomarker requirements, including BRAF, MSI, HER2, and RAS status.

NCT: NCT03803553 · Enrollment: 400 · Sites: Boston, New York

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 11

Neoadjuvant mFOLFOXIRI Plus Bevacizumab in Patients With High-Risk Locally Advanced Rectal Cancer

This clinical trial is testing the effectiveness of neoadjuvant chemotherapy with mFOLFOXIRI plus bevacizumab in patients with high-risk locally advanced rectal cancer. The intervention aims to eliminate potential micrometastases early while avoiding the adverse effects associated with radiotherapy, which can impact quality of life. This is a Phase 3 trial currently recruiting participants, indicating that it is in the later stages of testing and may provide valuable insights into treatment options for patients. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and RAS.

NCT: NCT04215731 · Enrollment: 582 · Sites: Guangzhou, China

MEDIUM PHASE3 Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING 11

Testing the Addition of Atezolizumab to Combination Chemotherapy or Atezolizumab Alone for Metastatic Colon or Rectal Cancer, the COMMIT Study

The COMMIT study is a phase III clinical trial evaluating the effectiveness of adding atezolizumab to combination chemotherapy or administering atezolizumab alone in patients with metastatic colorectal cancer characterized by deficient DNA mismatch repair. The intervention involves the use of atezolizumab, a monoclonal antibody that may enhance the immune system's ability to combat cancer, alongside standard chemotherapy agents like fluorouracil and bevacizumab, which target tumor growth and blood vessel formation. Currently, the trial is active but not recruiting new participants, indicating that it is in the process of collecting data from enrolled patients. Eligibility criteria include specific biomarkers such as MSI, MMR, and RAS, which are essential for determining the suitability of patients for this treatment approach.

NCT: NCT02997228 · Enrollment: 120 · Sites: Aberdeen, Akron, Albany, Albuquerque, Allentown

SIGNAL PHASE3 Stage IV BRAF LIQUID BIOPSY • NOT_YET_RECRUITING 10

De-scalation or swItch of Treatment According to Circulating tuMOr DNA Variation After 2 Cycles of Doublet Chemotherapy Plus Targeted Agent in Metastatic Unresectable Colorectal Cancer

This clinical trial is testing the effectiveness of treatment adaptation based on circulating tumor DNA (ctDNA) variation in patients with metastatic unresectable colorectal cancer (mCRC) after two cycles of doublet chemotherapy plus a targeted agent. The intervention involves adjusting treatment according to ctDNA levels, which may provide insights into tumor dynamics and therapeutic efficacy, potentially leading to improved patient outcomes. This is a Phase 3 trial that is not yet recruiting, meaning patients will need to wait for enrollment to begin before participating. Eligibility criteria include specific biomarker requirements related to BRAF, RAS, and circulating tumor DNA.

NCT: NCT06446557 · Enrollment: 408 ·

SIGNAL PHASE3 Stage III ctDNA LIQUID BIOPSY • RECRUITING 10

Investigate the Efficacy of Chemotherapy in Patients With Positive ctDNA After Surgery and Adjuvant Chemotherapy for a Stage III Colorectal Cancer

This clinical trial is investigating the efficacy of chemotherapy in patients with positive circulating tumor DNA (ctDNA) following surgery and adjuvant chemotherapy for stage III colorectal cancer. The intervention includes FOLFIRI and Trifluridine drug regimens, along with biological assessments and imaging studies, to evaluate their impact on disease recurrence. This is a Phase 3 trial currently recruiting 1,660 participants, which means eligible patients may have the opportunity to contribute to research that could influence future treatment protocols. Eligibility criteria include the presence of ctDNA, as well as specific biomarkers such as RAS and NGS.

NCT: NCT06197425 · Enrollment: 1660 · Sites: Dijon, France

MEDIUM PHASE3 Stage III MSI/MMR TARGETED THERAPY • NOT_YET_RECRUITING 10

Personalizing Chemotherapy Selection After Surgery for Patients With Stage III Colorectal Cancer Using a Blood Test

The CIRCULATE-III trial is testing the use of circulating tumor DNA (ctDNA) to personalize chemotherapy selection for patients with Stage III colorectal cancer after surgery. The intervention involves comparing different chemotherapy regimens, including capecitabine and oxaliplatin, to determine the most effective treatment based on ctDNA status. This is a Phase III trial that is not yet recruiting, meaning patients will need to wait for enrollment to begin before participating. Eligibility criteria include testing for specific biomarkers such as MSI, MMR, and DMMR.

NCT: NCT07340567 · Enrollment: 2450 · Sites: Gothenburg, Sweden, Lund, Sweden, Stockholm, Sweden, Uppsala, Sweden, Villejuif, France

SIGNAL PHASE2, PHASE3 All Stages RESEARCH • RECRUITING 10

Antegrade Intestinal Fluid Reinfusion for Prevention of Low Anterior Resection Syndrome After Low Anterior Resection: a Single-Center, Prospective Randomized Controlled Trial.

This clinical trial is testing the effectiveness of antegrade intestinal fluid reinfusion in preventing low anterior resection syndrome (LARS) in patients with a prophylactic ileal stoma. The intervention involves administering either intestinal fluid or potable water through the ileal stoma prior to ileostomy reversal surgery, which is important for understanding optimal management strategies for LARS. Currently in Phase 2 and Phase 3, the trial is actively recruiting 160 participants, which means eligible patients can join to contribute to this research. Eligibility criteria include having undergone anterior rectal resection and requiring ileostomy reversal.

NCT: NCT07537998 · Enrollment: 160 · Sites: Guangzhou, China

MEDIUM N/A Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 10

Prospective National Cohort Evaluating Predictive Biomarkers of Resistance to Immunotherapy in Patients With MSI/dMMR Metastatic Colorectal Cancer (CORESIM)

The CORESIM trial is evaluating predictive biomarkers of resistance to immunotherapy in patients with metastatic colorectal cancer characterized by microsatellite instability (MSI) or mismatch repair deficiency (dMMR). The study focuses on identifying biomarkers such as MSI, MSI-H, MMR, DMMR, and MICROSATELLITE to understand resistance to pembrolizumab, an anti-PD1 monoclonal antibody, in first-line treatment. Currently in the recruiting phase, this trial aims to enroll 600 participants, which may help refine treatment strategies for patients with MSI/dMMR metastatic colorectal cancer. Eligibility criteria include the presence of MSI or dMMR status.

NCT: NCT06353854 · Enrollment: 600 · Sites: Bayonne, France, Beauvais, France, Besançon, France, Boujan-sur-Libron, France, Boulogne-sur-Mer, France

MEDIUM PHASE1, PHASE2 Stage IV MSI/MMR LIQUID BIOPSY • RECRUITING 10

FOG-001 in Locally Advanced or Metastatic Solid Tumors

This clinical trial is testing the safety and effectiveness of FOG-001 in participants with locally advanced or metastatic solid tumors. The intervention includes FOG-001, along with other drugs such as mFOLFOX-6, Nivolumab, Trifluridine/tipiracil, and Bevacizumab, which are being evaluated for their potential benefits in this patient population. Currently in Phase 1 and Phase 2, the trial is actively recruiting participants, which means eligible patients may have the opportunity to receive these treatments as part of the study. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, CTDNA, and NGS.

NCT: NCT05919264 · Enrollment: 595 · Sites: Aurora, Baltimore, Boston, Charlottesville, Cleveland

MEDIUM PHASE3 Stage IV HER2 TARGETED THERAPY • RECRUITING 10

A Study of Tucatinib With Trastuzumab and mFOLFOX6 Versus Standard of Care Treatment in First-line HER2+ Metastatic Colorectal Cancer

This clinical trial is testing the efficacy of tucatinib in combination with trastuzumab and mFOLFOX6 compared to standard of care treatments for patients with HER2 positive metastatic colorectal cancer. The intervention involves the use of tucatinib, a targeted therapy, alongside other established cancer drugs, to evaluate its effectiveness and side effects in this patient population. Currently in Phase 3 and actively recruiting, this trial aims to provide insights into progression-free survival outcomes for participants. Eligibility criteria include having HER2 positive colorectal cancer that is metastatic or unresectable, with specific biomarker requirements related to HER2 and RAS.

NCT: NCT05253651 · Enrollment: 400 · Sites: Anaheim, Atlanta, Aurora, Aventura, Baldwin Park

MEDIUM PHASE2 Stage IV MSI/MMR LIQUID BIOPSY • ACTIVE_NOT_RECRUITING 10

Fecal Microbiota Transplant and Re-introduction of Anti-PD-1 Therapy (Pembrolizumab or Nivolumab) for the Treatment of Metastatic Colorectal Cancer in Anti-PD-1 Non-responders

This phase II clinical trial is investigating the combination of fecal microbiota transplantation and the re-introduction of anti-PD-1 therapy (pembrolizumab or nivolumab) for patients with metastatic colorectal cancer who have not responded to previous anti-PD-1 treatments. The intervention includes procedures such as fecal microbiota transplantation and the use of specific drugs, which aim to enhance the immune response against cancer by restoring the gut microbiome. Currently, the trial is active but not recruiting new participants, indicating that it is ongoing with enrolled patients receiving treatment. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, CTDNA, microsatellite status, and mismatch repair status.

NCT: NCT04729322 · Enrollment: 15 · Sites: Houston

MEDIUM PHASE3 Stage II IMMUNOTHERAPY • NOT_YET_RECRUITING 9

A Multicenter Study of Active Specific Immunotherapy With OncoVax® in Patients With Stage II Colon Cancer

This clinical trial is testing the effectiveness of OncoVAX® in patients with Stage II colon cancer. The intervention involves using OncoVAX, a biological therapy that aims to mobilize the immune system to prevent cancer recurrence by utilizing the patient's own cancer cells. This is a Phase III study that is currently not yet recruiting, meaning patients will need to wait for enrollment to begin before participating. Eligibility criteria may include specific characteristics related to the patient's cancer stage and treatment history.

NCT: NCT02448173 · Enrollment: 550 · Sites: Port Orange

SIGNAL PHASE3 Stage III MSI/MMR RESEARCH • NOT_YET_RECRUITING 9

SCRT + Chemo Targeted Immuno-neoadjuvant Therapy for High-risk pMMR/MSS RC

This clinical trial is testing an intensified treatment regimen for patients with high-risk locally advanced mismatch repair proficient/microsatellite stable (pMMR/MSS) rectal adenocarcinoma. The intervention includes short-course radiotherapy, mFOLFOX6 chemotherapy, a PD-1 monoclonal antibody, and targeted therapies (cetuximab or bevacizumab) based on RAS/BRAF status, which may improve treatment outcomes. This is a Phase 3 trial that is not yet recruiting, meaning patients will need to wait for enrollment to begin before participating. Eligibility criteria include being diagnosed with high-risk pMMR/MSS rectal adenocarcinoma and may involve specific biomarker assessments.

NCT: NCT07549399 · Enrollment: 204 · Sites: Guangzhou, China

Neoadjuvant CAPOX With or Without Pucotenlimab Plus Selective Radiotherapy for Locally Advanced Rectal Cancer

This clinical trial is testing the effectiveness of neoadjuvant CAPOX with or without pucotenlimab in patients with locally advanced rectal cancer. The intervention involves administering four cycles of CAPOX, a chemotherapy regimen, combined with the investigational drug pucotenlimab, which may enhance treatment outcomes. This is a phase III trial currently recruiting 556 participants, which means patients may have the opportunity to access this treatment approach while contributing to the evaluation of its efficacy and safety. Eligible patients must have pMMR/MSS locally advanced rectal cancer and will be randomized based on mesorectal fascia status.

NCT: NCT07528209 · Enrollment: 556 · Sites: Guangzhou, China

MEDIUM PHASE3 Stage IV HER2 TARGETED THERAPY • NOT_YET_RECRUITING 9

A Clinical Study to Evaluate Injection TQB2102 for the Treatment of Patients With HER2 IHC3+ Advanced Colorectal Cancer Who Progressed After Treatment With Oxaliplatin, Irinotecan and Fluoropyrimidine-Based Drugs

This clinical trial is evaluating the efficacy and safety of Injection TQB2102 for patients with HER2 IHC3+ advanced colorectal cancer who have progressed after treatment with oxaliplatin, irinotecan, and fluoropyrimidine-based drugs. The intervention, TQB2102, is being compared to the investigator's choice of treatment, which may include Trifluridine/Tipiracil (TAS-102), Fruquintinib, or Regorafenib, and aims to assess its impact on progression-free survival. This is a Phase III trial that is currently not yet recruiting, meaning patients cannot enroll at this time. Eligibility criteria include a confirmed HER2 IHC3+ status and prior treatment failure with specified chemotherapy regimens.

NCT: NCT07483684 · Enrollment: 142 · Sites: Beijing, China, Changchun, China, Changsha, China, Chengdu, China, Chongqing, China

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • NOT_YET_RECRUITING 9

Neoadjuvant Immunotherapy ± Radiotherapy in MSI-H/dMMR Locally Advanced Colorectal Cancer

This phase II clinical trial is testing the efficacy and safety of three neoadjuvant regimens in patients with locally advanced microsatellite instability-high/mismatch repair-deficient (MSI-H/dMMR) colorectal cancer. The interventions include dual immune checkpoint blockade with nivolumab plus ipilimumab, nivolumab plus radiotherapy, and nivolumab monotherapy, which are important for evaluating different approaches to enhance treatment outcomes. The trial is not yet recruiting participants, meaning patients will need to wait for enrollment to begin before they can participate. Eligibility criteria include having tumors that are MSI-H or dMMR, and patients with low rectal cancer may have the option for a watch-and-wait strategy if a complete response is achieved.

NCT: NCT07403877 · Enrollment: 114 · Sites: Shanghai, China

Pre-Operative Treatment in REseCTable COlon CanceR

This clinical trial is testing the efficacy of preoperative treatments for patients with advanced colon cancer, including those with upper rectal involvement, who are clinically staged as cT3-4 and/or cN+. The intervention involves three chemotherapy regimens: mFOLFOXIRI, mFOLFOX-6, and CAPOX, which are being evaluated for their impact on disease-free survival and patient-reported quality of life compared to standard postoperative care. This is a phase III study that is not yet recruiting, meaning patients will need to wait for enrollment to begin before participating. Eligibility criteria include specific staging requirements and biomarker assessments for RAS and microsatellite status.

SIGNAL PHASE2, PHASE3 Stage III RESEARCH • RECRUITING 8

Total Neoadjuvant Therapy and Organ Preservation Versus Surgery for Rectal Cancer.

This clinical trial is testing the effectiveness of total neoadjuvant therapy (TNT) and a watch-and-wait strategy for patients with rectal cancer. The intervention includes radiation therapy, chemoradiotherapy, and consolidation chemotherapy, with the aim of potentially allowing patients to preserve their rectum if they achieve a complete or near-complete clinical response. Currently in Phase 2 and Phase 3, the trial is recruiting 400 participants, which means eligible patients may have the opportunity to contribute to research that could impact treatment approaches. Eligibility criteria include patients with cT1N1, T2-T3 N0-1 rectal cancer, and specific markers such as MRF- and EMVI-.

NCT: NCT06758830 · Enrollment: 400 · Sites: Vilnius, Lithuania

Combination of IV Ascorbic Acid and Adebrelimab in Metastatic Colorectal Cancer

This clinical trial is testing the combination of intravenous ascorbic acid, Adebrelimab, and the FOLFOX protocol in patients with metastatic colorectal cancer who have high expression of the GLUT3 biomarker. The intervention involves administering ascorbic acid alongside a PD-L1 antibody and standard chemotherapy, which may enhance treatment efficacy based on previous preclinical findings. This is a Phase 3 trial currently recruiting 400 participants, indicating that it is in the later stages of testing and may provide valuable information on the effectiveness of this combination therapy for patients. Eligibility criteria include having metastatic colorectal cancer with high GLUT3 expression.

NCT: NCT04516681 · Enrollment: 400 · Sites: Shanhai, China

Personalized Long-course Radiotherapy Plus Chemotherapy With or Without Immunotherapy for LARC: PALACE Study

The PALACE study is a phase III clinical trial designed for patients with locally advanced rectal cancer (LARC) to evaluate the complete response rate to personalized long-course radiotherapy combined with chemotherapy, with or without the anti-PD-1 antibody drug Serplulimab. This intervention aims to determine the effectiveness of adding immunotherapy to standard treatment in achieving a complete response, defined as a pathological complete response plus a clinical complete response sustained for over one year. Currently, the trial is recruiting participants, which means eligible patients have the opportunity to join and contribute to this research. Eligibility criteria include specific biomarkers such as MMR and RAS.

NCT: NCT07020247 · Enrollment: 184 · Sites: Chengdu, China

The Sagittarius Trial

The Sagittarius Trial is testing the effectiveness of personalized therapy based on liquid biopsy results in patients with high-risk stage II and stage III colorectal cancer. The intervention involves a combination of drugs, including Oxaliplatin, Capecitabine, Folinic acid, Fluorouracil, and Temozolomide, which aims to improve outcomes and quality of life compared to conventional therapy. This is a Phase 3 trial currently recruiting 700 participants, which means eligible patients may have the opportunity to receive either standard or customized treatment based on their tumor genetics. Eligibility criteria include being diagnosed with high-risk stage II or stage III colon cancer and undergoing liquid biopsy testing.

NCT: NCT06490536 · Enrollment: 700 · Sites: Barcelona, Spain, Berlin, Germany, Biella, Italy, Brescia, Italy, Candiolo, Italy

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 8

Dostarlimab for Locally Advanced or Metastatic Cancer (Non-colorectal/Non-endometrial) With Tumor dMMR/MSI

This clinical trial is testing the efficacy of dostarlimab, an immunotherapy drug, for adult patients with locally advanced or metastatic cancers that are not colorectal or endometrial and have deficient mismatch repair (dMMR) or microsatellite instability (MSI). The intervention involves comparing dostarlimab to standard chemotherapy as a first-line treatment, which is significant for understanding alternative therapeutic options for these specific cancer types. This is a Phase 2 trial currently recruiting 120 participants, which means eligible patients may have the opportunity to receive either treatment while contributing to research on their effectiveness. Eligibility criteria include adults aged 18 and older with specific cancer types, including duodenum and small bowel adenocarcinoma, gastric adenocarcinoma, and others with documented dMMR/MSI status.

NCT: NCT06333314 · Enrollment: 120 · Sites: Angers, France, Avignon, France, Besançon, France, Brest, France, Caen, France

Rectal Cancer And Pre-operative Induction Therapy Followed by Dedicated Operation. The RAPIDO Trial

The RAPIDO trial is testing the effectiveness of pre-operative induction therapy followed by dedicated surgery in patients with locally advanced rectal cancer. The intervention involves a combination of a short-course radiotherapy scheme and standard long-course chemoradiotherapy, which aims to improve local control of the tumor prior to surgery. This is a Phase 3 trial that is currently active but not recruiting, indicating that it is in the advanced stages of evaluation and may provide insights into treatment options for patients. Eligibility criteria may include specific disease characteristics, but further details on biomarkers or other requirements are not provided.

NCT: NCT01558921 · Enrollment: 920 · Sites: St Louis

The Northern-European Initiative on Colorectal Cancer

The Northern-European Initiative on Colorectal Cancer (NordICC) is a Phase 3 clinical trial designed to evaluate the effectiveness of colonoscopy screening in reducing colorectal cancer (CRC) incidence and mortality among individuals aged 55-64 years. The intervention involves a colonoscopy procedure, which is significant as it can detect and remove precursor lesions that may lead to CRC, potentially preventing the disease. Currently, the trial is active but not recruiting, indicating that it is ongoing with enrolled participants, and results will be assessed after 15 years of follow-up. Eligibility criteria include being part of the specified age group and drawn randomly from population registries in the participating Nordic countries, the Netherlands, and Poland.

SIGNAL PHASE3 Stage IV BRAF RESEARCH • NOT_YET_RECRUITING 7

Pressurized Intraperitoneal Aerosolized Chemotherapy With Mitomycin for the Treatment of Unresectable Appendix or Colorectal Cancer With Peritoneal Metastases, The IMPACT Trial

The IMPACT trial is a phase III clinical study evaluating the effectiveness of pressurized intraperitoneal aerosolized chemotherapy (PIPAC) with mitomycin in patients with unresectable appendix or colorectal cancer that has metastasized to the peritoneal cavity. The intervention involves delivering chemotherapy as a pressurized mist directly into the abdominal cavity during a minimally invasive laparoscopic procedure, which may enhance drug absorption and distribution compared to standard chemotherapy regimens. Currently, the trial is not yet recruiting participants, meaning patients will need to wait for enrollment to begin before they can participate. Eligibility criteria include specific biomarker assessments such as BRAF, RAS, mismatch repair status, and next-generation sequencing (NGS).

iRECIST Evaluation's Relevance for DCR in MMR/MSI Metastatic Colorectal Cancer Patients on Nivolumab and Ipilimumab

This clinical trial is evaluating the disease control rate (DCR) in patients with metastatic colorectal cancer who have specific biomarkers, including MSI, MSI-H, MMR, DMMR, and RAS, while receiving treatment with the drugs nivolumab and ipilimumab. The intervention involves administering ipilimumab and nivolumab to assess their effectiveness in controlling disease progression. This is a Phase 2 trial that is currently active but not recruiting new participants, indicating that the study is ongoing and data is being collected from the enrolled patients. Eligibility for participation requires the presence of certain biomarkers related to the cancer's characteristics.

SIGNAL PHASE2, PHASE3 All Stages RESEARCH • ACTIVE_NOT_RECRUITING 7

Perioperative Systemic Therapy for Isolated Resectable Colorectal Peritoneal Metastases

This clinical trial is testing the effectiveness of perioperative systemic therapy combined with cytoreductive surgery and HIPEC in patients with isolated resectable colorectal peritoneal metastases. The intervention includes various combinations of chemotherapy regimens (CAPOX, FOLFOX, FOLFIRI) with bevacizumab, alongside the experimental procedure of cytoreductive surgery with HIPEC. Currently in Phase II-III and marked as active but not recruiting, this trial aims to determine if the combination therapy improves overall survival compared to surgery alone. Eligibility criteria include having isolated resectable colorectal peritoneal metastases, although specific biomarker requirements are not detailed.

NCT: NCT02758951 · Enrollment: 358 · Sites: Amsterdam, Netherlands, Eindhoven, Netherlands, Genk, Belgium, Groningen, Netherlands, Nieuwegein, Netherlands

MEDIUM PHASE2 Stage IV BRAF LIQUID BIOPSY • NOT_YET_RECRUITING 6

SBRT Followed by PD-1 Inhibitor, Bevacizumab and TAS-102 as Third-Line Therapy for Recurrent/Metastatic Colorectal Cancer

combination of SBRT followed by sintilimab, bevacizumab, and TAS-102 improves progression-free survival in patients with recurrent or metastatic colorectal cancer who have already undergone at least two lines of systemic therapy. The intervention involves administering SBRT to lung or liver metastases, followed by a regimen of immune checkpoint inhibitors and targeted therapies, which may enhance treatment efficacy. This is a Phase II trial that is not yet recruiting, meaning patients will need to wait for enrollment to begin before participating. Eligibility criteria include specific biomarkers such as BRAF, MSI, and MMR status, which may help identify suitable candidates for this treatment approach.

NCT: NCT07535632 · Enrollment: 58 · Sites: Shanghai, China

MEDIUM PHASE2 Stage IV BRAF TARGETED THERAPY • NOT_YET_RECRUITING 6

Testing Ivonescimab in Combination With Chemotherapy in Patients With Metastatic Colorectal Cancers Without Liver Metastases

This clinical trial is testing the efficacy of ivonescimab in combination with the FOLFIRI chemotherapy regimen in patients with metastatic colorectal cancer (mCRC) who do not have liver metastases. The intervention involves administering ivonescimab alongside FOLFIRI, comparing its effectiveness to the standard treatment of FOLFIRI combined with bevacizumab, with a focus on progression-free survival (PFS). This is a Phase 2 trial that is currently not yet recruiting, meaning patients will need to wait until enrollment begins to participate. Eligibility criteria include specific biomarkers such as BRAF, MSI, MMR, and RAS status, which will determine patient inclusion in the study.

NCT: NCT07359456 · Enrollment: 130 · Sites: Auxerre, France, Beuvry, France, Caen, France, Calais, France, Compiègne, France

Everolimus in CDK12-Deficient Metastatic Colorectal Cancer (EVER-RECODE)

The EVER-RECODE trial is evaluating the safety and preliminary efficacy of everolimus in patients with CDK12-deficient refractory metastatic colorectal cancer. The intervention involves administering everolimus (Afinitor) tablets, which is significant for its potential impact on treatment outcomes in this specific patient population. This study is currently in Phase 1 and Phase 2 and is not yet recruiting participants, meaning that patients will need to wait until recruitment begins to participate. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and microsatellite instability.

NCT: NCT07435584 · Enrollment: 38 ·

MEDIUM PHASE2 Stage IV BRAF TARGETED THERAPY • NOT_YET_RECRUITING 5

A Clinical Study on the Treatment of Metastatic Colorectal Cancer at the Second-line or Beyond.

This clinical trial is testing the efficacy and safety of irinotecan liposome combined with capecitabine, bevacizumab, and camrelizumab for patients with metastatic colorectal cancer who are receiving second-line treatment or beyond. The intervention involves a combination of these drugs, which is significant for potentially improving treatment outcomes in this patient population. This is a Phase 2 trial that is currently not yet recruiting, meaning patients will need to wait until enrollment begins to participate. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, MMR, DMMR, and RAS.

NCT: NCT07395063 · Enrollment: 68 ·

MEDIUM N/A Stage III MSI/MMR TARGETED THERAPY • RECRUITING 5

Neoadjuvant Therapy With Tislelizumab for dMMR/MSI-H Stage II-III Colorectal Cancer

This clinical trial is evaluating the efficacy and safety of tislelizumab monotherapy as neoadjuvant therapy for patients with mismatch repair deficient or microsatellite instability high (dMMR/MSI-H) stage II-III colorectal cancer. The intervention involves administering three cycles of tislelizumab before surgery, which is significant as it aims to improve pathological complete response rates in this patient population. The trial is currently in the recruiting phase, meaning eligible patients can still enroll to participate in the study. Eligibility criteria include having dMMR/MSI-H status, which is essential for determining suitability for this specific treatment approach.

NCT: NCT07352280 · Enrollment: 30 · Sites: Beijing, China

MEDIUM PHASE2 Stage IV BRAF TARGETED THERAPY • RECRUITING 5

A Study to Evaluate the Safety and Efficacy of Two Dose Levels of ONO-4578 With Opdivo®, in Combination With mFOLFOX6 and Bevacizumab Versus Standard of Care in Participants With Non-MSI-H/dMMR, PD-L1 Positive Advanced Colorectal Cancer

This clinical trial is evaluating the safety and efficacy of two dose levels of ONO-4578 in combination with Opdivo®, mFOLFOX6, and bevacizumab for participants with non-MSI-H/dMMR, PD-L1 positive advanced colorectal cancer. The intervention involves the addition of ONO-4578 to standard treatment regimens, which may provide insights into its effectiveness in this specific patient population. This is a Phase 2 trial that is currently recruiting participants, indicating that eligible patients may have the opportunity to receive this investigational treatment. Eligibility criteria include specific biomarker requirements such as BRAF, MSI, MMR, and dMMR status.

NCT: NCT06948448 · Enrollment: 144 · Sites: Columbus, Jacksonville, Lone Tree, Los Angeles, Norfolk

MEDIUM PHASE2 Stage IV BRAF TARGETED THERAPY • RECRUITING 5

The Safety and Efficacy of Cetuximab Beta Plus Fruquintinib With or Without Immune Checkpoint Inhibitorrs in First-line Treatment of RAS/BRAF Wild Type Unresectable Metastatic Colorectal Cancer

This clinical trial is testing the safety and efficacy of Cetuximab Beta combined with Fruquintinib, with or without immune checkpoint inhibitors, in patients with RAS/BRAF wild type unresectable metastatic colorectal cancer. The intervention involves targeted therapies that aim to improve treatment outcomes while potentially avoiding the side effects associated with traditional chemotherapy. This is a Phase 2 trial currently recruiting 70 participants, which means eligible patients may have the opportunity to receive these investigational treatments as part of their first-line therapy. Eligibility criteria include specific biomarker requirements such as BRAF, MSI, MSI-H, MMR, DMMR, and RAS status.

NCT: NCT07257653 · Enrollment: 70 · Sites: Hangzhou, China

MEDIUM PHASE2 Stage II MSI/MMR TARGETED THERAPY • RECRUITING 5

Immunotherapy (Toripalimab) for Reducing Recurrence Risk After Surgery for Mismatch Repair Deficient Stage IIB, IIC, or III Colon Cancer

This phase II clinical trial is evaluating the effectiveness of immunotherapy with toripalimab in reducing the risk of cancer recurrence after surgery in patients with mismatch repair deficient stage IIB, IIC, or III colon cancer. The intervention involves several procedures, including biopsy, biospecimen collection, colonoscopy, and computed tomography, which are essential for assessing treatment response and monitoring disease status. Currently, the trial is in the recruiting phase, meaning eligible patients can still enroll to participate in the study. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, RAS, and others related to mismatch repair.

NCT: NCT07140679 · Enrollment: 40 · Sites: Atlanta, Johns Creek

MEDIUM PHASE2 Stage IV BRAF TARGETED THERAPY • NOT_YET_RECRUITING 5

A Study on the Efficacy and Safety of Irinotecan Liposome (II), 5-FU/LV in Combination With Bevacizumab for the Treatment of Advanced Colorectal Cancer

This clinical trial is testing the efficacy and safety of irinotecan liposome (II), 5-FU/LV in combination with bevacizumab for patients with advanced colorectal cancer. The intervention involves a combination of these drugs, which is important for assessing their potential effectiveness in treating this condition. This is a Phase 2 trial that is currently not yet recruiting, meaning that patients will need to wait until recruitment begins to participate. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, MMR, DMMR, RAS, and those assessed through next-generation sequencing (NGS).

NCT: NCT07123441 · Enrollment: 300 · Sites: Shanghai, China

MEDIUM PHASE1 All Stages KRAS TARGETED THERAPY • RECRUITING 5

A Study to Find a Suitable Dose of ASP5834 in Adults With Solid Tumors

This clinical trial is testing the safety and dosage of ASP5834 in adults with solid tumors, specifically those with certain KRAS gene mutations, including colorectal cancer. The intervention involves administering ASP5834 alone or in combination with panitumumab, a known treatment for colorectal cancer, to evaluate its effects on the body and identify any potential side effects. This is a Phase 1 trial currently recruiting participants, which means it is in the early stages of testing to determine the safety and appropriate dosing of the drug. Eligibility criteria include having specific biomarkers related to KRAS and mismatch repair status.

NCT: NCT07094204 · Enrollment: 364 · Sites: Atlanta, Buffalo, Cleveland, Fairfax, Grand Rapids

MEDIUM PHASE2 Stage IV BRAF TARGETED THERAPY ● NOT_YET_RECRUITING 5

QL1706 Plus Bevacizumab for Unresectable or Metastatic MSI-H/dMMR CRC

This clinical trial is testing the combination of QL1706 and bevacizumab for patients with unresectable or metastatic colorectal cancer that is microsatellite instability-high (MSI-H) or mismatch repair-deficient (dMMR). The intervention involves administering QL1706 at 5.0 mg/kg and bevacizumab at 7.5 mg/kg every three weeks, which may provide insights into the efficacy and safety of this treatment approach. Currently, the trial is in Phase 2 and is not yet recruiting participants, meaning that patients will need to wait until enrollment begins to participate. Eligibility criteria include specific biomarker requirements such as BRAF, MSI, MSI-H, MMR, dMMR, and RAS status.

NCT: NCT07009145 · Enrollment: 22 · Sites: Jinan, China

MEDIUM PHASE1 Stage IV MSI/MMR TARGETED THERAPY ● RECRUITING 5

Clinical Trial of an Anti-cancer Drug, CA-4948 (Emavusertib), in Combination With Chemotherapy Treatment (FOLFOX Plus Bevacizumab) in Metastatic Colorectal Cancer

This clinical trial is testing the anti-cancer drug CA-4948 (Emavusertib) in combination with the chemotherapy regimen FOLFOX plus bevacizumab for patients with metastatic colorectal cancer. The intervention involves administering CA-4948 alongside established chemotherapy agents to evaluate its potential to inhibit tumor cell growth by blocking specific enzymes, while the chemotherapy drugs work through various mechanisms to combat cancer. This is a Phase 1 trial currently recruiting participants, which means it is primarily focused on assessing safety and determining the appropriate dosage for future studies. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, RAS, and microsatellite status.

NCT: NCT06696768 · Enrollment: 24 · Sites: City of Saint Peters, Creve Coeur, Fairway, Gainesville, Kansas City

MEDIUM EARLY_PHASE1 Stage IV MSI/MMR TARGETED THERAPY ● RECRUITING 5

A Dose-Expansion Trial of Intravenous HNF4α srRNA for Unresectable or Metastatic Colorectal Cancer

This clinical trial is testing the safety and efficacy of intravenous HNF4α srRNA (CD-GA-102) in patients with unresectable locally advanced or metastatic colorectal cancer. The intervention involves administering CD-GA-102 as a monotherapy or in combination with immunotherapy and other systemic treatments, which is important for understanding its potential role in managing this cancer type. Currently in the early phase 1 stage and actively recruiting, this trial aims to gather data on the objective response rate, which may inform future treatment options for patients. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, RAS, and microsatellite status.

NCT: NCT07050394 · Enrollment: 20 · Sites: Shanghai, China

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY ● RECRUITING 5

Phase II Clinical Trial of Cadonilimab Combined With Anti-angiogenic Agents in Metastatic dMMR/MSI-H CRC

This Phase II clinical trial is evaluating the efficacy and safety of cadonilimab combined with anti-angiogenic agents in patients with recurrent or metastatic colorectal cancer characterized by dMMR/MSI-H. The intervention involves cadonilimab in combination with an anti-angiogenic agent, selected from bevacizumab, regorafenib, or fruquintinib, which may enhance treatment outcomes for this specific patient population. The trial is currently recruiting 40 participants, indicating that eligible patients may have the opportunity to receive this combination therapy while the study is ongoing. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and RAS, as well as prior exposure to PD-1/PD-L1 antibody therapy.

NCT: NCT07003022 · Enrollment: 40 · Sites: Shanghai, China

MEDIUM PHASE1, PHASE2 Stage IV BRAF TARGETED THERAPY ● RECRUITING 5

Glumetinib Combined With Fruquintinib in the Treatment of MET Amplification or Protein Overexpression in Third-Line Unresectable Metastatic Colorectal Cancer

This clinical trial is testing the combination of Glumetinib and Fruquintinib for patients with third-line unresectable metastatic colorectal cancer who have MET amplification or protein overexpression. The intervention involves the use of these two drugs to evaluate their efficacy and safety in this specific patient population. Currently, the trial is in Phase 1 and Phase 2 and is actively recruiting participants, which means eligible patients may have the opportunity to receive this treatment while contributing to the research. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, MMR, DMMR, and microsatellite status, as well as next-generation sequencing (NGS) results.

NCT: NCT06980532 · Enrollment: 42 · Sites: Wuhan, China

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 5

Y-90, Capecitabine, and Atezolizumab for Oligometastatic CRC

The BrUOG-430 trial is evaluating the combination of yttrium-90 radioembolization, capecitabine, and atezolizumab for patients with unresectable colorectal cancer liver metastases who have previously received two or more lines of systemic therapy. This intervention aims to assess its preliminary efficacy based on the intrahepatic disease control rate at 12 weeks. Currently in Phase 2 and actively recruiting, this trial offers patients the opportunity to participate in a study focused on a specific treatment approach for their condition. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, TMB, RAS, and microsatellite instability.

NCT: NCT06555133 · Enrollment: 18 · Sites: Providence

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 5

SCRT Combined With Chemotherapy and Iparomlimab and Tuvonralimab in MSS or pMMR Patients With Locally Advanced Rectal Cancer

This clinical trial is testing a novel neoadjuvant regimen for patients with locally advanced rectal cancer (LARC) classified as T3-4/N+ without distant metastasis. The intervention involves short-course radiotherapy followed by four cycles of CAPEOX combined with the drugs Iparomlimab and Tuvonralimab, aiming to improve organ preservation and treatment efficacy. Currently in Phase 2 and actively recruiting, this trial offers patients the opportunity to participate in a study that may enhance treatment outcomes for LARC. Eligibility criteria include patients with microsatellite stable (MSS) or mismatch repair proficient (pMMR) tumors, as well as specific biomarker assessments related to microsatellite instability and mismatch repair.

NCT: NCT06864013 · Enrollment: 116 · Sites: Hangzhou, China

Retrospective Study on the Use of Immunotherapy in Patients With MSI-H Metastatic Colorectal Cancer

This clinical trial is a retrospective study examining the use of immunotherapy in patients with microsatellite instability-high (MSI-H) metastatic colorectal cancer (mCRC). The intervention involves the use of immune checkpoint inhibitors, specifically pembrolizumab and nivolumab, which are significant for their role in targeting the immune response against cancer cells. The trial is currently active but not recruiting, indicating that it is in the data collection phase, which may provide insights into treatment effectiveness for patients who have exhausted other options. Eligibility criteria include having MSI-H status, which is essential for determining the appropriateness of immunotherapy in this patient population.

NCT: NCT04612309 · Enrollment: 100 · Sites: Carpi, Italy

MEDIUM PHASE1, PHASE2 Stage IV BRAF TARGETED THERAPY • RECRUITING 5

BOLD-100 in Combination With FOLFOX for the Treatment of Advanced Solid Tumours

This clinical trial is testing the combination of BOLD-100 with FOLFOX chemotherapy for patients with advanced solid tumors. BOLD-100 is an intravenously administered small molecule that targets tumor cells by decreasing the expression of GRP78, which may enhance the effectiveness of FOLFOX. The trial is currently in Phase 1 and Phase 2 and is actively recruiting participants, indicating that patients may have the opportunity to receive this treatment while the study is ongoing. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, HER2, and microsatellite status.

NCT: NCT04421820 · Enrollment: 220 · Sites: Santa Monica, Tampa

Neo-adjuvant Pembrolizumab and Radiotherapy in Localised MSS Rectal Cancer

This clinical trial is testing the combination of pembrolizumab and short course radiotherapy in patients with localized microsatellite stable (MSS) rectal cancer. The intervention involves administering pembrolizumab, an immunotherapy drug, alongside radiotherapy to evaluate its effects on tumor regression. This is a Phase 2 trial that is currently recruiting participants, which means eligible patients may have the opportunity to receive this treatment while contributing to the research. Eligibility criteria include having localized MSS rectal cancer and specific biomarker assessments related to microsatellite stability.

NCT: NCT04109755 · Enrollment: 25 · Sites: Geneva, Switzerland

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING 5

Pd1 Antibody Sintilimab ± Chemoradiotherapy for Locally Advanced Rectal Cancer

This clinical trial is testing the efficacy of the PD-1 antibody Sintilimab in combination with chemoradiotherapy for patients with locally advanced rectal cancer, specifically focusing on those with different MMR/MSI statuses. The intervention involves administering Sintilimab alongside oxaliplatin, capecitabine, and radiotherapy, which may influence treatment outcomes based on the tumor's biomarker profile. Currently in Phase 2 and marked as active but not recruiting, this trial indicates that patients are not being enrolled at this time, but results may inform future treatment options. Eligibility criteria include specific biomarker requirements such as MMR, MSI, and RAS status.

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY ● RECRUITING 5

KN035 for dMMR/MSI-H Advanced Solid Tumors

This clinical trial is testing the efficacy of KN035 in patients with previously-treated locally-advanced or metastatic colorectal carcinoma and other solid tumors characterized by mismatched repair deficiency (dMMR) or microsatellite instability-high (MSI-H). The intervention involves KN035, a biological therapy, which is significant for its potential to target specific tumor characteristics associated with these conditions. Currently in Phase 2 and actively recruiting, this trial aims to evaluate the objective response rate (ORR) for participants. Eligible colorectal cancer patients must have received prior standard therapies, while participants with other solid tumors must have undergone at least one line of systemic standard of care therapy.

NCT: NCT03667170 · Enrollment: 200 · Sites: Beijing, China

MEDIUM PHASE2 Stage IV RAS IMMUNOTHERAPY ● RECRUITING 5

Immunotherapy Using Tumor Infiltrating Lymphocytes for Patients With Metastatic Cancer

This clinical trial is testing an experimental immunotherapy using Tumor Infiltrating Lymphocytes (TIL) for adults aged 18-72 with metastatic cancers, specifically targeting those with digestive tract, urothelial, breast, or ovarian/endometrial tumors. The intervention involves the administration of Pembrolizumab (Keytruda), Fludarabine, Cyclophosphamide, Aldesleukin, and Young TIL, which are designed to enhance the body’s immune response against tumors. This is a Phase 2 trial currently recruiting participants, indicating that it is in the early stages of evaluating the treatment's effectiveness and safety. Eligibility criteria include adults with specific cancer types and a biomarker requirement related to RAS.

MEDIUM PHASE2 All Stages MSI/MMR TARGETED THERAPY • NOT_YET_RECRUITING 4

Chemotherapy Plus Bevacizumab and Anti-PD-1 Followed by Induction Therapy of Chemotherapy Plus Bevacizumab

This clinical trial is testing the combination of chemotherapy, bevacizumab, and an anti-PD-1 monoclonal antibody for patients with initial unresectable metastatic colorectal cancer (mCRC) of the MSS type. The intervention involves the mFOLFOX6 regimen along with bevacizumab and a PD-1 monoclonal antibody, which may enhance treatment efficacy and improve patient outcomes. This is a Phase 2 trial that is currently not yet recruiting, meaning patients will need to wait for enrollment to begin before participating. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, and DMMR.

NCT: NCT06415851 · Enrollment: 36 · Sites: Hanzhou, China

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 4

Nanoliposomal Irinotecan, Oxaliplatin Plus Capecitabine As Conversion Therapy of Locally Advanced Colorectal Cancer

This clinical trial is testing the efficacy and safety of nanoliposomal irinotecan, oxaliplatin, and capecitabine as conversion therapy for patients with locally advanced colorectal cancer. The intervention involves a combination of these drugs, which is significant as it aims to improve the organ-sparing R0 resection rate in this patient population. Currently in Phase 2 and actively recruiting, this trial may provide insights into treatment options for patients with locally advanced disease. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and RAS.

NCT: NCT06405139 · Enrollment: 36 · Sites: Beijing, China

MEDIUM NA Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 4

Study on the Safety and Efficacy of MR-Linac Technique in Patients With Unresectable Locally Advanced Colon Cancer

This clinical trial is testing the safety and efficacy of the MR-Linac technique in patients with unresectable locally advanced colon cancer. The intervention involves the use of MR-Linac for short course radiotherapy, followed by chemotherapy and surgical resection, which is significant for potentially improving treatment outcomes in this patient population. The study is currently in the recruiting phase and aims to enroll 20 participants, indicating that eligible patients may still join the trial. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, and DMMR.

NCT: NCT06244537 · Enrollment: 20 · Sites: Chengdu, China

MEDIUM PHASE1, PHASE2 Stage IV IMMUNOTHERAPY • RECRUITING 4

GM103 Intratumoral Injection in Patients With Locally Advanced, Unresectable, Refractory and/or Metastatic Solid Tumors

This clinical trial is testing the safety and efficacy of GM103, administered alone and in combination with pembrolizumab, in patients with locally advanced, unresectable, refractory, and/or metastatic solid tumors, including colorectal cancer. The intervention involves the intratumoral injection of GM103, which is being evaluated for its potential to improve treatment outcomes in this patient population. Currently in Phase 1 and Phase 2, the trial is actively recruiting participants, which means eligible patients may have the opportunity to receive this investigational treatment. Eligibility criteria include having specific types of solid tumors, and the study will assess the percentage of patients experiencing dose-limiting toxicities across different treatment cohorts.

NCT: NCT06265025 · Enrollment: 125 · Sites: Goyang-si, South Korea, Seoul, South Korea

MEDIUM PHASE1 All Stages BRAF TARGETED THERAPY • RECRUITING 4

FIH, Bispecific CD276xCD3 Antibody CC-3 in Patients With Colorectal Cancer

of the trial is testing the bispecific antibody CC-3 in patients with colorectal cancer who have experienced failure of at least three prior therapies. The intervention involves the administration of CC-3, which targets both CD276 on cancer cells and tumor vessels, potentially enhancing its anti-cancer effects while minimizing side effects due to reduced off-target T cell activation. This is a Phase 1 trial currently recruiting participants, which means patients may have the opportunity to access this investigational treatment while contributing to the understanding of its safety and efficacy. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, MMR, DMMR, and RAS.

NCT: NCT05999396 · Enrollment: 89 · Sites: Tübingen, Germany

MEDIUM PHASE1, PHASE2 Stage IV KRAS TARGETED THERAPY • RECRUITING 4

Study of Elironrasib and Daraxonrasib as Monotherapies and Combination Therapy in Participants With Advanced KRAS G12C Mutant Solid Tumors

This clinical trial is evaluating the safety and tolerability of Elironrasib and Daraxonrasib, both as monotherapies and in combination, for participants with advanced KRAS G12C mutant solid tumors. The intervention involves two drugs, Elironrasib and Daraxonrasib, which are being tested to understand their pharmacokinetics and potential effects on this specific mutation. Currently in Phase 1 and Phase 2, the trial is actively recruiting participants, which means eligible patients may have the opportunity to receive these treatments. Eligibility criteria include having tumors with KRAS G12C mutations, among other potential biomarker requirements.

NCT: NCT06128551 · Enrollment: 534 · Sites: Aurora, Boston, Dallas, Detroit, Duarte

SIGNAL NA Stage IV ctDNA LIQUID BIOPSY • RECRUITING 4

Circulating Tumor DNA Methylation Guided Postoperative Follow-up Strategy for Non-metastatic Colorectal Cancer

This clinical trial is testing a postoperative follow-up strategy for patients with non-metastatic colorectal cancer using circulating tumor DNA (ctDNA) methylation monitoring. The intervention involves dynamic monitoring of ctDNA methylation, which is significant for assessing treatment efficacy and predicting recurrence. The trial is currently in the recruiting phase, meaning eligible patients can still enroll to participate in the study. Eligibility criteria include having non-metastatic colorectal cancer and the presence of ctDNA as a biomarker.

NCT: NCT05904665 · Enrollment: 584 · Sites: Shanghai, China

MEDIUM PHASE1, PHASE2 Stage IV MSI/MMR TARGETED THERAPY • RECRUITING 4

Cadonilimab for PD-1/PD-L1 Blockade-refractory, MSI-H/dMMR, Advanced Colorectal Cancer

This clinical trial is testing the efficacy of cadonilimab in patients with advanced colorectal cancer who are refractory to PD-1/PD-L1 blockade and have microsatellite instability-high (MSI-H) or mismatch repair-deficient (dMMR) tumors. The intervention, cadonilimab, is a drug that targets the immune checkpoint pathway, which is significant for patients who have not responded to other therapies. This trial is currently in Phase 1 and Phase 2 and is actively recruiting participants, indicating that eligible patients may have the opportunity to access this treatment option. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, dMMR, RAS, and microsatellite status.

NCT: NCT05426005 · Enrollment: 28 · Sites: Guangzhou, China

SIGNAL NA All Stages RESEARCH • RECRUITING 4

GENOCARE: A Prospective, Randomized Clinical Trial of Genotype-Guided Dosing Versus Usual Care

The GENOCARE trial is testing the effectiveness of genotype-guided dosing of irinotecan compared to usual care in patients with pancreatic cancer and colorectal cancer who are UGT1A1 intermediate metabolizers and usual UGT metabolizers. The intervention involves tailoring the dosing of irinotecan based on genetic testing, which may help optimize treatment outcomes and minimize adverse effects. This trial is currently in the recruiting phase, meaning eligible patients can still enroll to participate in the study. Participants must have specific UGT1A1 genotypes, either intermediate (*1/*28) or usual (*1/*1), to qualify for randomization in the trial.

NCT: NCT05391126 · Enrollment: 178 · Sites: Lexington

SIGNAL | N/A | Stage III | ctDNA | LIQUID BIOPSY | ● RECRUITING | 4

ctDNA Methylation Application in Postoperative Relapse and Adjuvant Chemotherapy Efficacy Evaluation

This clinical trial is testing a multi-locus blood-based assay targeting circulating tumor DNA (ctDNA) methylation in patients with resected stage I and stage II colorectal cancer who are at low risk for recurrence. The intervention aims to monitor postoperative relapse and evaluate the efficacy of adjuvant chemotherapy, which is important for optimizing treatment strategies in this patient population. The trial is currently in the recruiting phase, meaning eligible patients can still enroll to participate. Eligibility criteria include having undergone radical resection for stage I or stage II colorectal cancer without high-risk features.

NCT: NCT05536089 · Enrollment: 2000 · Sites: Hangzhou, China

MEDIUM | PHASE1 | All Stages | MSI/MMR | IMMUNOTHERAPY | ● RECRUITING | 4

Study of Zanzalintinib in Combination With Immuno-Oncology Agents in Participants With Solid Tumors

This clinical trial is evaluating the safety and efficacy of zanzalintinib, both as a monotherapy and in combination with immuno-oncology agents, in participants with advanced solid tumors. The intervention involves zanzalintinib, nivolumab, and ipilimumab, which are being tested to assess their safety, tolerability, and preliminary antitumor activity. This is a Phase 1b trial currently recruiting participants, which means that it is in the early stages of testing to determine the best dosing and safety profile before larger studies can be conducted. Eligibility criteria include the presence of specific biomarkers, such as microsatellite instability.

NCT: NCT05176483 · Enrollment: 1314 · Sites: Austin, Baltimore, Boston, Celebration, Charlottesville

MEDIUM | PHASE2 | Stage III | MSI/MMR | TARGETED THERAPY | ● ACTIVE_NOT_RECRUITING | 4

Atezolizumab in Patients With MSI-h/MMR-D Stage II High Risk and Stage III Colorectal Cancer Ineligible for Oxaliplatin

This clinical trial is testing the efficacy of atezolizumab in patients with stage II high-risk and stage III colorectal cancer who are ineligible for oxaliplatin. The intervention involves administering atezolizumab, a drug that targets the immune system, alongside IMM-101, to potentially enhance disease-free survival in this specific patient population. Currently in Phase 2 and marked as active but not recruiting, this trial indicates that patients are not being enrolled at this time, but results may inform future treatment options. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and RAS, which are essential for determining patient suitability for the trial.

MEDIUM | PHASE1 | Stage IV | IMMUNOTHERAPY | ● RECRUITING | 4

A Study Evaluating the Safety and Efficacy of Targeted Therapies in Subpopulations of Patients With Metastatic Colorectal Cancer (INTRINSIC)

The INTRINSIC trial is evaluating the safety and efficacy of targeted therapies and immunotherapy in patients with metastatic colorectal cancer (mCRC) whose tumors are biomarker positive. The intervention includes several drugs: Inavolisib, Bevacizumab, Cetuximab, Atezolizumab, and Tiragolumab, which are being tested as single agents or in combination to determine their effectiveness. This is a Phase 1 study currently recruiting participants, which means it is in the early stages of testing to assess safety and initial efficacy. Eligible participants will be assigned to specific treatment arms based on their biomarker assay results.

NCT: NCT04929223 · Enrollment: 542 · Sites: Aurora, Baton Rouge, Birmingham, Boston, Detroit

MEDIUM PHASE1, PHASE2 All Stages IMMUNOTHERAPY • RECRUITING 4

A Beta-only IL-2 ImmunoTherapY Study

This clinical trial is testing the safety and effectiveness of MDNA11, both as a monotherapy and in combination with Pembrolizumab (Keytruda®), for patients with advanced solid tumors. The intervention involves a dose-escalation and expansion study to determine the recommended doses for both monotherapy and combination therapy, which is important for optimizing treatment strategies. Currently in Phase 1/2 and actively recruiting, this trial offers patients the opportunity to participate in early-stage research that may inform future treatment options. Eligibility criteria may include specific biomarkers, although details are not provided.

NCT: NCT05086692 · Enrollment: 115 · Sites: Atlanta, Boca Raton, Detroit, Houston, San Diego

MEDIUM PHASE1, PHASE2 Stage IV IMMUNOTHERAPY • ACTIVE_NOT_RECRUITING 4

Study of NGM707 As Monotherapy and in Combination with Pembrolizumab in Advanced or Metastatic Solid Tumor Malignancies

This clinical trial is investigating the efficacy of NGM707, both as a monotherapy and in combination with pembrolizumab (KEYTRUDA®), in patients with advanced or metastatic solid tumor malignancies, including colorectal cancer. The intervention involves administering NGM707 alone and in combination with pembrolizumab to assess its safety and potential effectiveness. Currently, the trial is in Phase 1 and Phase 2 and is active but not recruiting, indicating that it is ongoing but not accepting new participants at this time. Eligibility criteria may include specific biomarkers, although details on these requirements are not provided.

NCT: NCT04913337 · Enrollment: 179 · Sites: Albany, Baltimore, Blacksburg, Boston, Dallas

MEDIUM PHASE2 Stage IV MSI/MMR TARGETED THERAPY • ACTIVE_NOT_RECRUITING 4

Two Combination Treatment Regimens of Nivolumab and Ipilimumab in Patients With dMMR and / or MSI mCRC.

This clinical trial is testing two combination treatment regimens of nivolumab and ipilimumab in patients with metastatic colorectal cancer (mCRC) who have deficient mismatch repair (dMMR) or microsatellite instability (MSI). The interventions involve administering nivolumab at two different dosages (480 mg and 240 mg) alongside ipilimumab, aiming to find a regimen that offers high clinical activity with reduced toxicity. This is a Phase II trial that is currently active but not recruiting, meaning that while the study is ongoing, no new participants are being enrolled at this time. Eligibility criteria include specific biomarkers such as MSI, MMR, dMMR, RAS, and microsatellite status.

NCT: NCT04730544 · Enrollment: 96 · Sites: Avignon, France, Besançon, France, Brest, France, Créteil, France, Dijon, France

MEDIUM PHASE1 All Stages HER2 TARGETED THERAPY • ACTIVE_NOT_RECRUITING 4

CAR-macrophages for the Treatment of HER2 Overexpressing Solid Tumors

This clinical trial is testing the safety and tolerability of CAR-macrophages in patients with HER2 overexpressing solid tumors. The intervention involves the use of CT-0508 and Pembrolizumab, which are biological agents aimed at targeting and treating these specific tumors. Currently in Phase 1 and marked as active but not recruiting, this trial is focused on evaluating adverse events in the enrolled participants. Eligibility criteria include the requirement for tumors to overexpress the HER2 biomarker.

NCT: NCT04660929 · Enrollment: 48 · Sites: Chapel Hill, Duarte, Houston, Nashville, Philadelphia

MEDIUM PHASE1 Stage IV RAS TARGETED THERAPY • RECRUITING 4

Study of CRX100 as Monotherapy and in Combination With Pembrolizumab in Patients With Advanced Solid Malignancies

This clinical trial is testing the safety and efficacy of CRX100, both as a monotherapy and in combination with Pembrolizumab, in patients with advanced solid malignancies, including colorectal cancer. The intervention involves administering CRX100 suspension for infusion alongside Fludarabine and Cyclophosphamide, which is significant for understanding potential treatment options for these patients. Currently in Phase 1 and actively recruiting, this trial aims to assess treatment-emergent adverse events and dose-limiting toxicities, providing critical information on the safety profile of the therapies involved. Eligibility criteria include screening for specific biomarkers such as HER2 and RAS, as well as the presence of certain types of advanced solid tumors.

NCT: NCT04282044 · Enrollment: 60 · Sites: La Jolla, Scottsdale, Stanford

MEDIUM NA All Stages MSI/MMR TARGETED THERAPY • RECRUITING 4

Watch and Wait in PD-1 Monoclonal Antibody Treated dMMR/MSI-H Distal Rectal Cancer

This clinical trial is evaluating the "watch and wait" approach for patients with distal rectal cancer who have achieved a pathological complete response after treatment with PD-1 monoclonal antibodies. The intervention focuses on monitoring patients without immediate surgical intervention, which may reduce treatment-related complications and costs associated with radical resection. Currently in the recruiting phase, this trial aims to assess the one-year disease-free survival rate, providing insights into the effectiveness of this approach for eligible patients. Participants must have biomarkers indicating dMMR/MSI-H status, among other criteria.

NCT: NCT04643041 · Enrollment: 47 · Sites: Guangzhou, China

MEDIUM PHASE1, PHASE2 Stage IV IMMUNOTHERAPY • ACTIVE_NOT_RECRUITING 4

Safety, PK and Efficacy of ONC-392 in Monotherapy and in Combination of Anti-PD-1 in Advanced Solid Tumors and NSCLC

This clinical trial is testing the safety, pharmacokinetics, and efficacy of ONC-392, a humanized anti-CTLA4 IgG1 monoclonal antibody, in patients with advanced or metastatic solid tumors and non-small cell lung cancer (NSCLC). The intervention involves administering ONC-392 both as a monotherapy and in combination with pembrolizumab and docetaxel, which is significant for understanding its potential effectiveness in these cancer types. Currently, the trial is in Phase 1 and Phase 2 and is active but not recruiting, indicating that patients cannot enroll at this time. Eligibility criteria may include specific biomarkers, although details on these requirements are not provided.

NCT: NCT04140526 · Enrollment: 733 · Sites: Ann Arbor, Atlanta, Atlantis, Aurora, Baltimore

MEDIUM PHASE2 All Stages HER2 TARGETED THERAPY • ACTIVE_NOT_RECRUITING 4

Tucatinib Plus Trastuzumab and Oxaliplatin-based Chemotherapy or Pembrolizumab-containing Combinations for HER2+ Gastrointestinal Cancers

This clinical trial is testing the safety and efficacy of tucatinib in combination with trastuzumab and various chemotherapy regimens for patients with HER2-positive gastrointestinal cancers. The intervention involves tucatinib, a targeted therapy, alongside trastuzumab, oxaliplatin, leucovorin, and fluorouracil, to evaluate potential side effects and treatment effectiveness. Currently in Phase 2 and marked as active but not recruiting, this trial indicates that patients are not being enrolled at this time, but results may inform future treatment options. Eligibility criteria include having HER2-positive cancer affecting the gut, stomach, intestines, or gallbladder, as well as specific biomarker requirements related to HER2 and RAS.

NCT: NCT04430738 · Enrollment: 40 · Sites: Albuquerque, Aurora, City of Saint Peters, Cleveland, Creve Coeur

SIGNAL NA All Stages LIQUID BIOPSY • RECRUITING 4

Circulating DNA to Improve Outcome of Oncology PatiEnt. A Randomized Study

This clinical trial is testing the effectiveness of a liquid biopsy approach in improving outcomes for patients with colorectal cancer. The intervention involves using genetic analysis of circulating tumor DNA (ctDNA) to guide treatment decisions and monitor patient response, which may enhance overall survival. Currently in the recruiting phase, this phase II trial aims to enroll 332 participants and will compare two treatment arms to assess the impact of ctDNA analysis versus standard imaging follow-up. Eligibility criteria include being diagnosed with colorectal cancer and meeting specific biomarker requirements for participation.

NCT: NCT04258137 · Enrollment: 332 · Sites: Bayonne, France, Bordeaux, France, Brest, France, Pau, France

MEDIUM PHASE2 Stage IV RAS PHASE II TRIAL • ACTIVE_NOT_RECRUITING 4

Radiochemotherapy +/- Durvalumab for Locally-advanced Anal Carcinoma. a Multicenter, Randomized, Phase II Trial of the German Anal Cancer Study Group

The RADIANCE trial is evaluating the efficacy of durvalumab in combination with primary mitomycin C and 5-fluorouracil-based radiochemotherapy for patients with locally-advanced anal squamous cell carcinoma. This intervention is significant as it explores the potential benefits of adding a PD-L1 immune checkpoint inhibitor to standard treatment regimens. Currently, the trial is in Phase II and is active but not recruiting, indicating that it is ongoing and data collection is in progress, but no new participants are being enrolled at this time. Eligibility criteria include specific biomarkers such as RAS and NGS.

NCT: NCT04230759 · Enrollment: 180 · Sites: Berlin, Germany, Darmstadt, Germany, Dresden, Germany, Essen, Germany, Frankfurt, Germany

SIGNAL NA Stage III ctDNA LIQUID BIOPSY • ACTIVE_NOT_RECRUITING 4

ctDNA-guided Surveillance for Stage III CRC, a Randomized Intervention Trial

The IMPROVE-IT2 trial is testing ctDNA-guided surveillance for patients with Stage III colorectal cancer (CRC) to evaluate its effectiveness compared to standard CT-scan surveillance. The intervention involves ctDNA analysis as a diagnostic test, which aims to enhance the detection of recurrent disease and potentially increase the number of patients eligible for curative treatment. This trial is currently active but not recruiting participants, indicating that it is ongoing and data is being collected from enrolled patients. Eligibility criteria include the presence of ctDNA as a biomarker for assessment.

NCT: NCT04084249 · Enrollment: 359 · Sites: Aalborg, Denmark, Aarhus, Denmark, Copenhagen, Denmark, Herlev, Denmark, Herning, Denmark

MEDIUM NA All Stages TARGETED THERAPY • ACTIVE_NOT_RECRUITING 4

An Integrated Genomic Approach to Assess Genetic Risk and Drug Sensitivity

This clinical trial is assessing genetic risk and drug sensitivity in patients with colorectal cancer, among other cancer types. The intervention involves creating a genomic profile to evaluate germline and somatic mutations using the Gersom panel, which is significant for understanding individual treatment responses. The trial is currently active but not recruiting, indicating that while it is ongoing, no new participants are being enrolled at this time. Eligibility criteria include having colorectal cancer and may involve specific biomarker assessments, such as HER2.

NCT: NCT07555639 · Enrollment: 4000 · Sites: Roma, Italy

MEDIUM PHASE1 Stage IV RAS TARGETED THERAPY • ACTIVE_NOT_RECRUITING 4

Naptumomab Estafenatox in Combination With Durvalumab in Subjects With Selected Advanced or Metastatic Solid Tumor, Including a Cohort Expansion in Esophageal Cancer.

This clinical trial is testing the combination of naptumomab estafenatox and durvalumab in patients with selected advanced or metastatic solid tumors, including a cohort expansion specifically for esophageal cancer. The intervention involves a combination of these two agents to evaluate their safety and tolerability, which is important for determining effective treatment options for this patient population. Currently, the trial is in Phase 1b and is active but not recruiting, meaning that while it is ongoing, no new participants are being enrolled at this time. Eligibility criteria include specific biomarkers such as HER2, RAS, and NGS, which may be relevant for patient selection.

NCT: NCT03983954 · Enrollment: 120 · Sites: Ahmedabad, India, Haifa, Israel, Hyderabad, India, Jhajjar, India, New Delhi, India

MEDIUM PHASE2 Stage IV PHASE II TRIAL • ACTIVE_NOT_RECRUITING 4

Microwave Ablation Versus Stereotactic Body Radiotherapy for Colorectal Liver Metastases in Oligometastatic Disease: a Prospective, Randomised, Phase 2 Trial

The LAVA-CRLM trial is testing the effectiveness of microwave ablation (MWA) compared to stereotactic body radiotherapy (SBRT) in patients with colorectal liver metastases and oligometastatic disease. The intervention involves using MWA, a device-based treatment, and SBRT, a form of radiation therapy, to assess their impact on local control and safety in this patient population. This is a Phase 2 trial that is currently active but not recruiting, indicating that while the study is ongoing, no new participants are being enrolled at this time. Eligibility criteria for participation may include specific characteristics related to the patient's metastatic disease status.

NCT: NCT03654131 · Enrollment: 100 · Sites: Copenhagen, Denmark

MEDIUM PHASE2 All Stages RAS IMMUNOTHERAPY • ACTIVE_NOT_RECRUITING 4

Nivolumab and Ipilimumab in Treating Patients With Rare Tumors

This phase II clinical trial is investigating the efficacy of nivolumab and ipilimumab in treating patients with rare tumors. The intervention involves the use of these monoclonal antibodies, which may enhance the immune system's ability to combat cancer and inhibit tumor growth and spread. Currently, the trial is active but not recruiting new participants, indicating that it is ongoing with enrolled patients being monitored for outcomes. Eligibility criteria include specific tumor types, such as epithelial tumors of the nasal cavity and salivary glands, with a focus on RAS biomarkers.

NCT: NCT02834013 · Enrollment: 818 · Sites: Aberdeen, Adrian, Aitkin, Albuquerque, Allentown

MEDIUM PHASE2 All Stages NTRK TARGETED THERAPY ● ACTIVE_NOT_RECRUITING 4

Basket Study of Entrectinib (RXDX-101) for the Treatment of Patients With Solid Tumors Harboring NTRK 1/2/3 (Trk A/B/C), ROS1, or ALK Gene Rearrangements (Fusions)

This clinical trial is testing the efficacy of entrectinib (RXDX-101) in patients with solid tumors that have NTRK1/2/3, ROS1, or ALK gene rearrangements. The intervention, entrectinib, is a targeted therapy that aims to address specific genetic alterations in tumors, which may influence treatment outcomes. Currently in Phase 2 and marked as active but not recruiting, this trial indicates that patients may not be able to enroll at this time, but results could inform future treatment options. Eligibility criteria include the presence of specific gene fusions, such as NTRK, ROS1, or ALK.

NCT: NCT02568267 · Enrollment: 534 · Sites: Ann Arbor, Athens, Atlanta, Aurora, Baltimore

Appendix A — Patient Guide to Active Trials

For patients, caregivers, and family members. Always discuss with your oncologist before considering a clinical trial.

What is a clinical trial?

Clinical trials test new treatments, combinations, or approaches to care. Participating can give you access to treatments not yet widely available. Trials are listed by the biomarker your tumor must have — because many newer treatments only work for specific mutations. Ask your oncologist which biomarkers your tumor has been tested for, then look for matching trials below.

MSI/MMR
A Clinical Trial Comparing Long-Course Versus Short-Course Radiotherapy Followed by Immunotherapy Combined With Total Neoadjuvant Therapy (TNT) to Long-Course Radiotherapy Followed by TNT in Locally Advanced Rectal Cancer
Phase: PHASE3 · Status: RECRUITING · NCT07113275
This clinical trial is testing the efficacy of short-course versus long-course radiotherapy followed by immunotherapy combined with total neoadjuvant therapy (TNT) in patients with locally advanced rectal cancer. The interventions include short-course and long-course radiotherapy, along with the drugs capecitabine, oxaliplatin, and HLX10, which are important for evaluating different treatment approaches. Currently in Phase 3 and actively recruiting, this trial aims to enroll 444 participants, which may provide insights into treatment options for patients. Eligibility criteria include specific biomarkers such as MSI, MSI-H, MMR, DMMR, and RAS.

BRAF
JSKN003 Versus Physician Choiced Treatment in Patients With HER2-positive and Advanced Colorectal Cancer Who Had Failed to Respond to Oxaliplatin, 5-Fu, and Irinotecan
Phase: PHASE3 · Status: NOT_YET_RECRUITING · NCT07384377
This clinical trial is testing the efficacy and safety of JSKN003 compared to physician-chosen treatments in patients with HER2-positive and advanced colorectal cancer who have not responded to previous therapies, including oxaliplatin, 5-FU, and irinotecan. The intervention, JSKN003, is being evaluated to determine its effectiveness in improving patient outcomes, specifically progression-free survival (PFS). This is a Phase 3 trial that is not yet recruiting, meaning patients will need to wait for enrollment to begin before they can participate. Eligibility criteria include specific biomarkers such as BRAF, MSI, MSI-H, MMR, DMMR, HER2, and RAS.

KRAS
A Study of Amivantamab and FOLFIRI Versus Cetuximab/Bevacizumab and FOLFIRI in Participants With KRAS/NRAS and BRAF Wild-type Colorectal Cancer Who Have Previously Received Chemotherapy
Phase: PHASE3 · Status: RECRUITING · NCT06750094
This clinical trial is testing the efficacy of amivantamab combined with FOLFIRI chemotherapy compared to cetuximab or bevacizumab with FOLFIRI in patients with KRAS/NRAS and BRAF wild-type colorectal cancer who have previously undergone chemotherapy. The intervention involves the biological agents amivantamab, cetuximab, and bevacizumab, along with the chemotherapy drugs 5-fluorouracil and leucovorin, which are important for evaluating progression-free survival and overall survival in this patient population. This is a Phase 3 trial currently recruiting 700 participants, which indicates that it is in the later stages of testing and aims to provide more definitive evidence regarding treatment effectiveness. Eligibility criteria include specific biomarker requirements related to KRAS, NRAS, and BRAF status, among others.

ctDNA
ctDNA-guided Selection of Adjuvant Chemotherapy Regimens for Elderly Colon Cancer Patients After Surgery: A Single-center, Randomized, Controlled Study
Phase: PHASE3 · Status: RECRUITING · NCT06609551
This clinical trial is testing the effectiveness of ctDNA-guided selection of adjuvant chemotherapy regimens in elderly patients with high-risk stage II and stage III colon cancer following surgery. Participants will receive either 6 months of 5-FU monotherapy or an intensive XELOX treatment regimen, which is significant for tailoring chemotherapy based on ctDNA detection. Currently in Phase 3 and actively recruiting, this trial aims to provide insights into disease-free survival outcomes for eligible patients. Eligibility criteria include being an elderly patient with high-risk stage II or stage III colon cancer and undergoing ctDNA testing post-surgery.

HER2
A Study of Tucatinib With Trastuzumab and mFOLFOX6 Versus Standard of Care Treatment in First-line HER2+ Metastatic Colorectal Cancer
Phase: PHASE3 · Status: RECRUITING · NCT05253651

This clinical trial is testing the efficacy of tucatinib in combination with trastuzumab and mFOLFOX6 compared to standard of care treatments for patients with HER2 positive metastatic colorectal cancer. The intervention involves the use of tucatinib, a targeted therapy, alongside other established cancer drugs, to evaluate its effectiveness and side effects in this patient population. Currently in Phase 3 and actively recruiting, this trial aims to provide insights into progression-free survival outcomes for participants. Eligibility criteria include having HER2 positive colorectal cancer that is metastatic or unresectable, with specific biomarker requirements related to HER2 and RAS.

RAS

Post-resection/Ablation Chemotherapy in Patients With Metastatic Colorectal Cancer (FIRE-9 - PORT / AIO-KRK-0418)

Phase: PHASE3 · Status: RECRUITING · NCT05008809

The FIRE-9 trial is testing the efficacy of various chemotherapy regimens in patients with metastatic colorectal cancer who have undergone definitive interventional therapy for all lesions. The interventions include mFOLFOX6, mFOLFOXIRI, FOLFIRI, and CAPOX, which are important for assessing their impact on progression-free survival and patient-reported quality of life. This is a phase III study currently recruiting 507 participants, which means eligible patients may have the opportunity to receive active treatment while contributing to research on these therapies. Eligibility criteria include the presence of RAS biomarkers.

NGS

Evaluating Whether an Educational Website Called Current Together After Cancer (CTAC) Improves Follow-up Care for Colorectal Cancer Survivors

Phase: PHASE3 · Status: RECRUITING · NCT07018869

This phase III clinical trial is testing the effectiveness of an educational website called Current Together after Cancer (CTAC) for colorectal cancer survivors who have undergone surgical resection. The intervention involves access to the CTAC website, which aims to enhance patients' understanding of surveillance care and improve their confidence in managing follow-up care, addressing the significant gap where many survivors do not receive guideline-concordant surveillance. The trial is currently recruiting 1,057 participants, which means eligible patients can still join to potentially benefit from this intervention. Eligibility criteria include having undergone surgical resection for colorectal cancer and may involve specific biomarker assessments such as next-generation sequencing (NGS).

NTRK

Basket Study of Entrectinib (RXDX-101) for the Treatment of Patients With Solid Tumors Harboring NTRK 1/2/3 (Trk A/B/C), ROS1, or ALK Gene Rearrangements (Fusions)

Phase: PHASE2 · Status: ACTIVE_NOT_RECRUITING · NCT02568267

This clinical trial is testing the efficacy of entrectinib (RXDX-101) in patients with solid tumors that have NTRK1/2/3, ROS1, or ALK gene rearrangements. The intervention, entrectinib, is a targeted therapy that aims to address specific genetic alterations in tumors, which may influence treatment outcomes. Currently in Phase 2 and marked as active but not recruiting, this trial indicates that patients may not be able to enroll at this time, but results could inform future treatment options. Eligibility criteria include the presence of specific gene fusions, such as NTRK, ROS1, or ALK.

What this means for you

Ask your oncologist whether any active trials match your biomarker profile and disease stage. The most actively trialed biomarkers in colorectal cancer right now are **MSI/MMR, BRAF, KRAS, ctDNA, and HER2**. If your tumor has not been tested for these markers, ask your oncologist before your next treatment decision — biomarker results can determine which trials you qualify for.

Questions to ask your oncologist about trials

"Am I eligible for any active Phase III trials based on my biomarker profile?"
"Does my tumor need to be retested before I can qualify for a biomarker-directed trial?"
"What are the travel requirements and visit frequency for the trials I might qualify for?"

Source: ClinicalTrials.gov · 2026-06-08 07:30:00
This is not medical advice. Always speak with your oncologist before making any treatment decisions.

Appendix B — Clinical Trial Reference Guide

What the phases mean

Phase I — First testing in humans. Focus on safety and dosing. Small groups.

Phase II — Testing effectiveness. Larger groups. Determines if Phase III is warranted.

Phase III — Randomized comparison against standard treatment. Required for FDA approval.

Key biomarkers that determine trial eligibility

RAS (KRAS/NRAS) — mutation status affects anti-EGFR eligibility and KRAS G12C trial eligibility

BRAF V600E — required for encorafenib-based trials (~8–10% of CRC)

MSI-H/dMMR — required for immunotherapy trials; ~5% of mCRC, ~15% of Stage II/III

HER2 — required for HER2-directed trials (~2–3% of CRC)

NTRK fusion — required for TRK inhibitor trials (<1% of CRC)

KRAS G12C — required for sotorasib/adagrasib trials (~3–4% of CRC)

TMB-H — tumor mutational burden; may qualify for immunotherapy

ctDNA — liquid biopsy; used in MRD monitoring trials

How to find trials you may qualify for

1. Get complete biomarker testing: RAS, BRAF, MSI/MMR, HER2, NTRK, TMB
2. Search ClinicalTrials.gov with your biomarker and stage
3. Ask your oncologist about NCI-designated cancer centers with trial access
4. Contact the Colorectal Cancer Alliance: ccalliance.org

About This Report

This report is generated automatically from publicly available medical databases including PubMed, ClinicalTrials.gov, and the FDA Drug@FDA database. Entries are classified using deterministic rule-based logic and scored by clinical significance. AI-generated summaries are grounded exclusively in the source data provided.

Limitations

This report does not represent a complete picture of all published research or approved treatments. Database coverage, feed availability, and relevance filtering affect what appears. New drug approvals and trial status changes may not be reflected immediately. Always verify current information at the original source before making clinical decisions.

Disclaimer

Trial data is sourced from ClinicalTrials.gov, a registry maintained by the U.S. National Library of Medicine. Entry summaries are AI-generated from publicly available trial records. Trial status and eligibility criteria may change — always verify at ClinicalTrials.gov before acting on this information. This report is made available under a free-use license for patient advocacy organizations, oncology practices, and individual patients. You may share or distribute it freely. You may not modify it, remove attribution, or republish it as your own work. Authorship and all intellectual property rights are retained by Randy Hinton. This report is provided for informational purposes only and does not constitute medical advice. Always consult your oncologist or a qualified healthcare provider before making any treatment decisions.
