Score inputs: TGA trend: +1 | Reserves: +1 | RRP: +1 | Fed BS: 0 (+1 = expanding · -1 = contracting · 0 = neutral · band = ±0.5%)

RRP rule: when RRP < \$50B the facility is effectively drained and cash is deployed into markets (+1 by level, regardless of daily change). Above \$50B, signal follows weekly direction. Other inputs: signal fires when weekly change exceeds ±0.5% of prior value; within band = neutral (0).

ANALYSIS

DETERMINISTIC · COMPUTED FROM DTS DATA

The Treasury General Account closed at \$801.1B, versus an opening balance of \$830.4B, for a net daily change of -\$29.3B. On a week-over-week basis, the TGA declined by \$55.8B. At the current pace, the TGA would reach the \$500B threshold in approximately 67 days. A year ago the TGA stood at \$309.4B, leaving the current balance \$491.7B above that prior-year level.

Total deposits for the day were \$27.2B against withdrawals of \$56.5B, producing a net flow of -\$29.3B. Deposits were well below the 7-day average (-83.2%), compared to a 7-day rolling average of \$162.3B. Withdrawals were well below the 7-day average (-67.3%), relative to a 7-day average of \$172.8B. Over the prior 7 trading days (excluding today), cumulative deposits totaled \$1,135.8B versus withdrawals of \$1,209.3B, a net flow of -\$73.5B.

Total debt outstanding stands at \$39,213.3B, comprising \$31,592.4B held by the public and \$7,620.9B in intragovernmental holdings. Remaining headroom under the statutory limit of \$41,104.0B is \$1,890.7B. At the current average weekly growth rate of \$40.5B, the limit would be reached in approximately 46 weeks. Debt held by the public is \$2,667.1B higher than one year ago.

The TGA has been declining at an average of \$4.5B per day over the past 42 calendar days, injecting reserves into the banking system at that pace. The current TGA balance of \$801.1B represents 1.9% of the statutory debt limit. Continued drawdown at this rate would accelerate reserve injection ahead of any potential issuance-driven absorption.

Reserve balances held at the Federal Reserve stood at \$3,080.7B, up \$66.8B week-over-week. The Federal Reserve balance sheet stood at \$6,725.4B, up \$13.9B week-over-week. Overnight reverse repo (RRP) usage was \$0.5B, a low level that indicates money funds are deploying cash into markets. SOFR fixed at 3.600%, up 1.0 bp day-over-day. The composite Liquidity Score is +3/4 (EXPANDING), driven by TGA drawdown injecting reserves, rising reserve balances.

The 2-year Treasury yielded 4.050% (unchanged WoW) and the 10-year yielded 4.450% (▼ 1bp WoW). The 2s10s curve was +39bps (normal). The 10Y-3M spread, the Fed's preferred recession indicator, stood at +70bps (normal). The 10-year real yield was 2.16% with breakeven inflation at 2.31%. VIX closed at 19.44, up 3.67 week-over-week, signaling low stress vs. a 30-day average of 17.6.
