TGA CLOSING BALANCE BY WEEK OF YEAR — 2026 VS 21-YEAR AVERAGE (OCT 2005 – JUN 2026)

ANALYSIS

Deterministic · computed from DTS data

This report shows the seasonal pattern of the U.S. Treasury General Account (TGA) closing balance using 21 years of daily data (2005–2026), sourced from the Daily Treasury Statement published by the U.S. Treasury. Historical averages

include the extraordinary Treasury cash accumulation during 2020–2021 (COVID fiscal response) and the pre-GFC era of minimal cash buffers (2005–2008), making the full-sample average a structurally informative but wide baseline.

As of 2026-06-17 (ISO week 25), the TGA closed at \$956.5B, \$594.9B above the 21-year seasonal average of \$361.6B — ranked #2 of 21 years (95th percentile). The seasonal standard deviation for week 25 is \$392.0B; the current value is 1.52 standard deviations above the historical average (Z-score: +1.52). Notably, the current TGA of \$956.5B represents 255% of the 21-year seasonal peak average of \$374.6B — which itself typically occurs in week 17. Based on its deviation from seasonal norms, the current Treasury cash position is classified as: EXTREME BUFFER (+164% above the 21-year average). The more significant signal is the year-to-date picture: across all 25 weeks of 2026, the TGA has averaged \$544.8B above the seasonal norm, ranging from a low of \$+418.9B in week 1 to a high of \$+641.9B in week 16. This sustained deviation suggests Treasury has been carrying an unusually elevated cash buffer for most of the year, not just at this point in the calendar. The TGA has been above the seasonal average in 25 of 25 weeks (100%) so far in 2026, with a current streak of 25 consecutive weeks above the norm.

Based on the available history, the TGA seasonal average peaks in week 17 at \$374.6B and troughs in week 14 at \$234.0B — a seasonal swing of \$140.6B. The current reporting date is 8 weeks past the seasonal peak (week 17). The TGA remains historically elevated, but the recent trend has been relatively stable, suggesting continued reserve drain until spending patterns shift. Each \$100B decline in the TGA injects approximately \$100B of reserves into the banking system.

WEEK 25 — TOP HISTORICAL DEVIATIONS VS 21-YEAR AVERAGE ALL VALUES USD BILLIONS

Rank	Year	TGA Balance	vs 21-Yr Avg
#1	2020	\$1,635.5B	+1,273.9B
#2	2026 ★	\$956.5B	+594.9B
#3	2024	\$763.4B	+401.8B
#4	2022	\$758.5B	+396.9B
#5	2021	\$733.2B	+371.6B

★ = current year | Historical averages include extraordinary Treasury cash accumulation during 2020–2021 (COVID fiscal response) and low pre-GFC balances (2005–2008). These structural regime shifts are inherent to a long historical sample.

Era	Week 25 Avg Balance	vs Full-Sample Avg
Pre-COVID (2005–2019)	\$143.1B	-218.5B
COVID Peak (2020–2021)	\$1,635.5B	+1,273.9B
Post-COVID (2022–present)	\$644.5B	+282.9B
Current (2026)	\$956.5B	+594.9B

Data Source: Treasury General Account closing balance sourced from the U.S. Treasury Daily Treasury Statement (DTS), published daily at fiscaldata.treasury.gov and stored in the Thor Storehouse database. All values in USD billions (raw storage in millions, divided by 1,000).

Methodology: All values computed deterministically from timestamped source data. Seasonal averages use ISO week numbers (1–52); week 53 observations excluded. No AI model is involved. Same input data always produces identical output.

Disclaimer: This report is for informational purposes only and does not constitute investment advice. Data is believed accurate but not warranted. Figures are subject to revision by the U.S. Treasury.
